

A simulation of a wildfire. The image shows a large fire burning on a hillside, with thick, dark smoke rising into the sky. The fire is bright orange and yellow, contrasting with the dark smoke and the dark green trees in the foreground. The overall scene is dramatic and intense.

UNIONVILLE / HELENA

FIRE SPREAD AND SPOTTING POTENTIAL

SIMULATION

DEVELOPED BY:
SONNY STIGER, Fuels Management Consultant
& ROCKY INFANGER, Chief, Wolf Cr./Craig FSA
January 2007 Modified August 2009

Modeling System. USDA Forest Service.

**TRI-COUNTY FIRESAFE WORKING GROUP
FUEL HAZARD MAP
(AREA OF SIMULATION)**

- A** – Low fuel hazard.
- B** – Medium fuel hazard.
- C** - High risk fuel hazard
- X** – High to severe fuel hazard

This is what the forest looked like before active fire suppression

A photograph of a forest slope. The foreground and middle ground are filled with a dense growth of small, young trees, likely pines or spruces, growing closely together. Several larger, mature trees are scattered throughout the slope, some standing alone and others in small groups. The ground appears to be covered in a layer of dry grass or low-lying vegetation. The background shows a dense canopy of trees, with a bright sky visible through the branches. The overall scene suggests a forest that has been shaped by natural processes, such as fire, which would have cleared the dense growth of small trees.

Before active fire suppression small
ground fires would get rid of the small
dense growth of trees

**Does your property look like
this**

**If it does you should be
concerned about a fire**

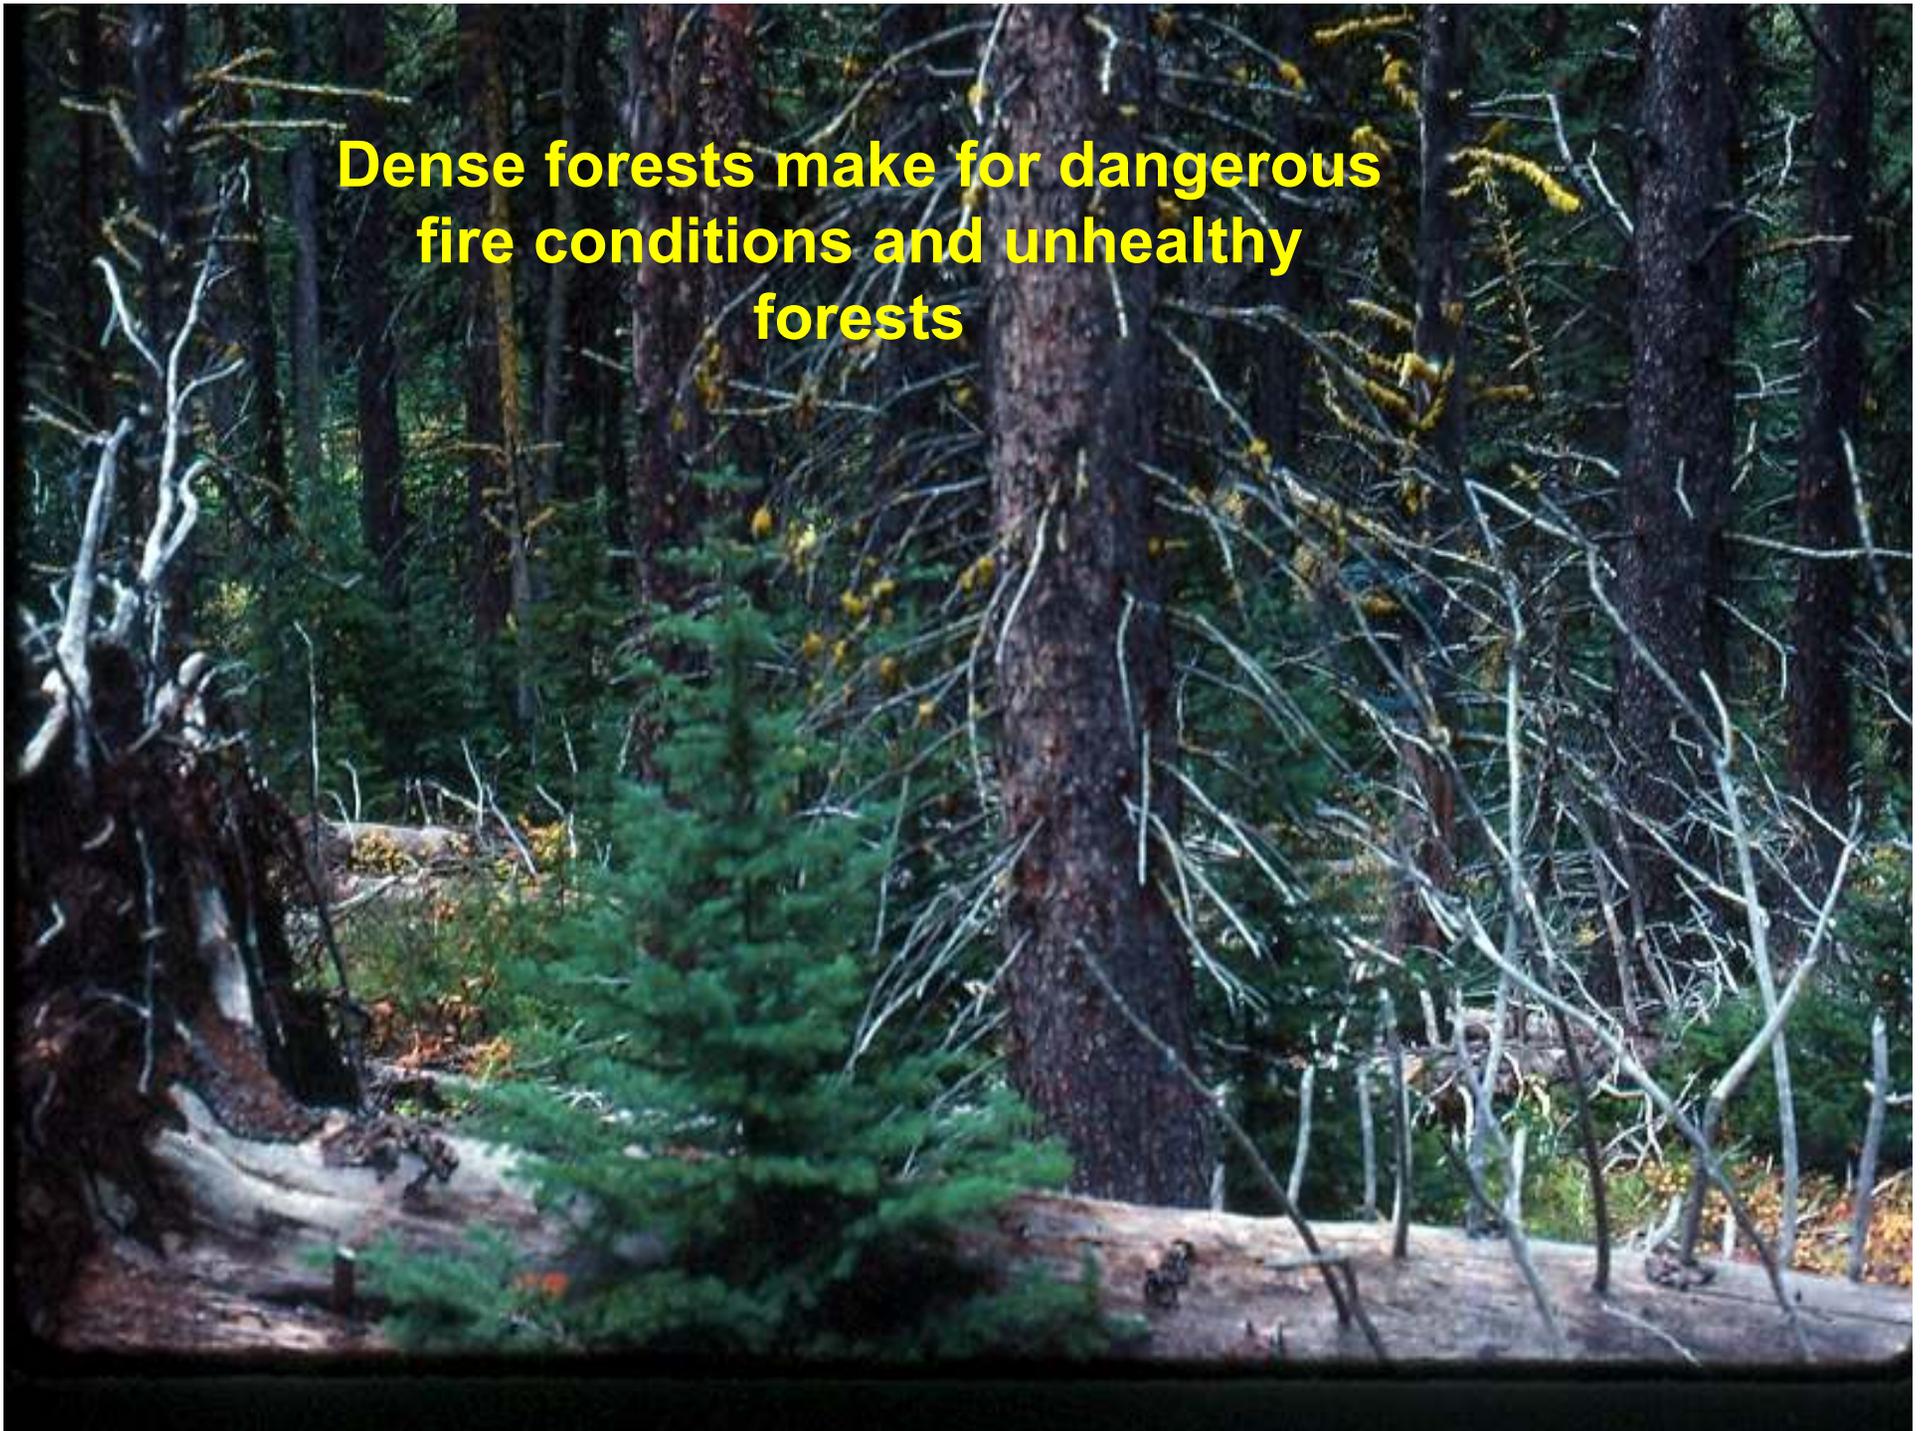

Its time to protect yourself

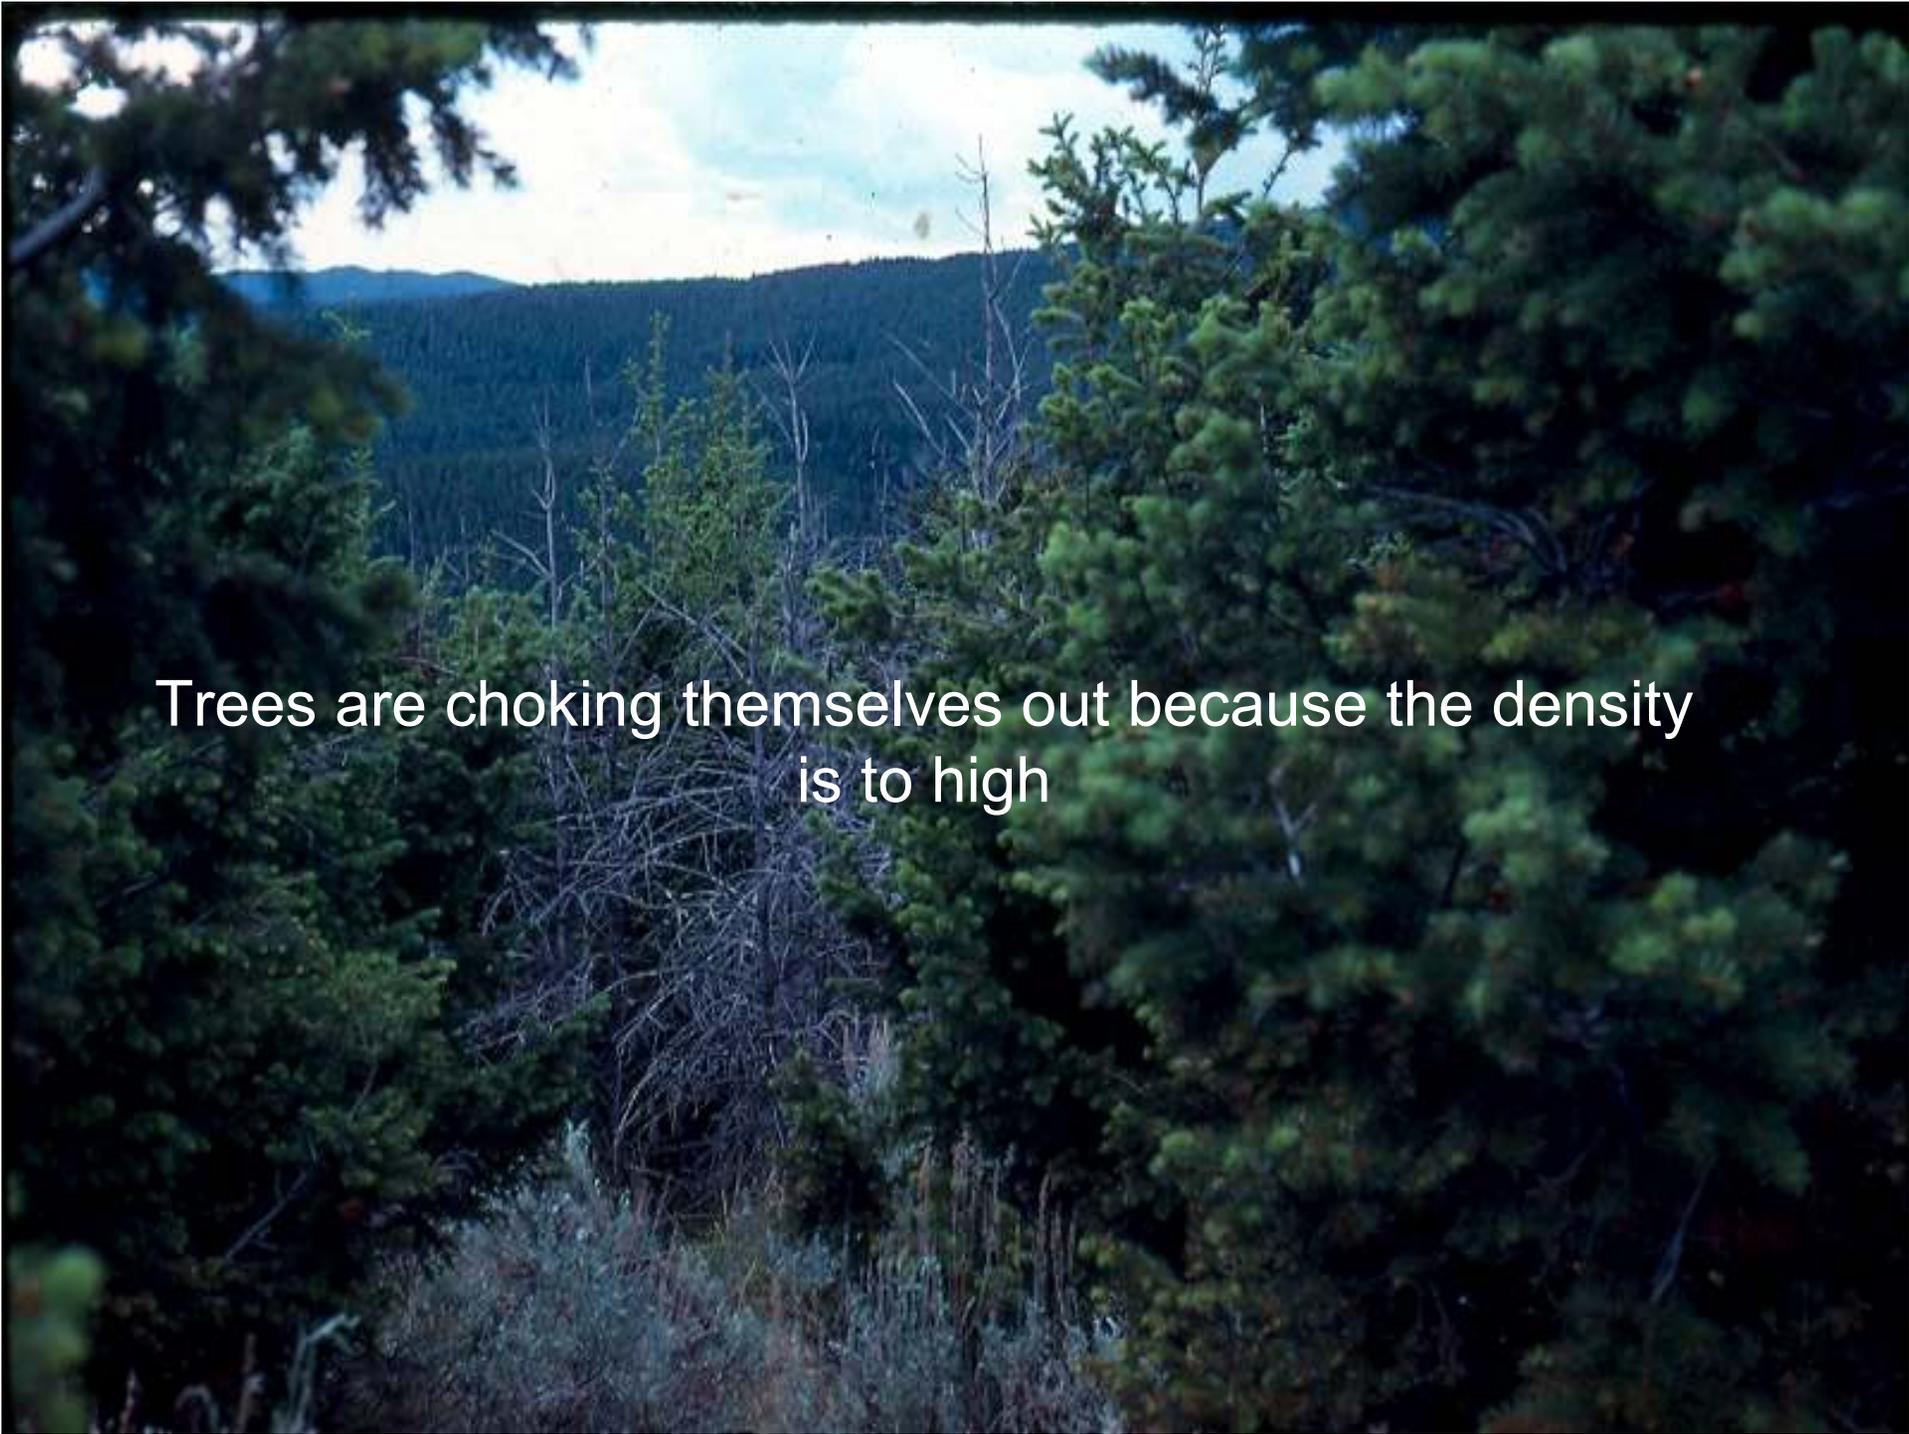

Its time for Defensible Space

A photograph showing a large fire burning in a field of trees. The fire is intense, with bright orange and yellow flames visible through the dark green foliage. Thick, dark smoke rises from the fire, filling the sky and partially obscuring the sun. The foreground consists of a grassy field with several small, young trees. The overall scene is dramatic and illustrates the impact of a fire in a wooded area.

Tight growths of trees cause a fire to increase in speed and intensity

**Dense forests make for dangerous
fire conditions and unhealthy
forests**

A photograph showing a dense forest of evergreen trees. In the foreground, several trees are dead and skeletal, with bare branches reaching upwards. The background shows a vast expanse of living green trees stretching towards a distant mountain range under a cloudy sky. The overall scene suggests a forest where high density is leading to the death of some trees.

Trees are choking themselves out because the density is to high

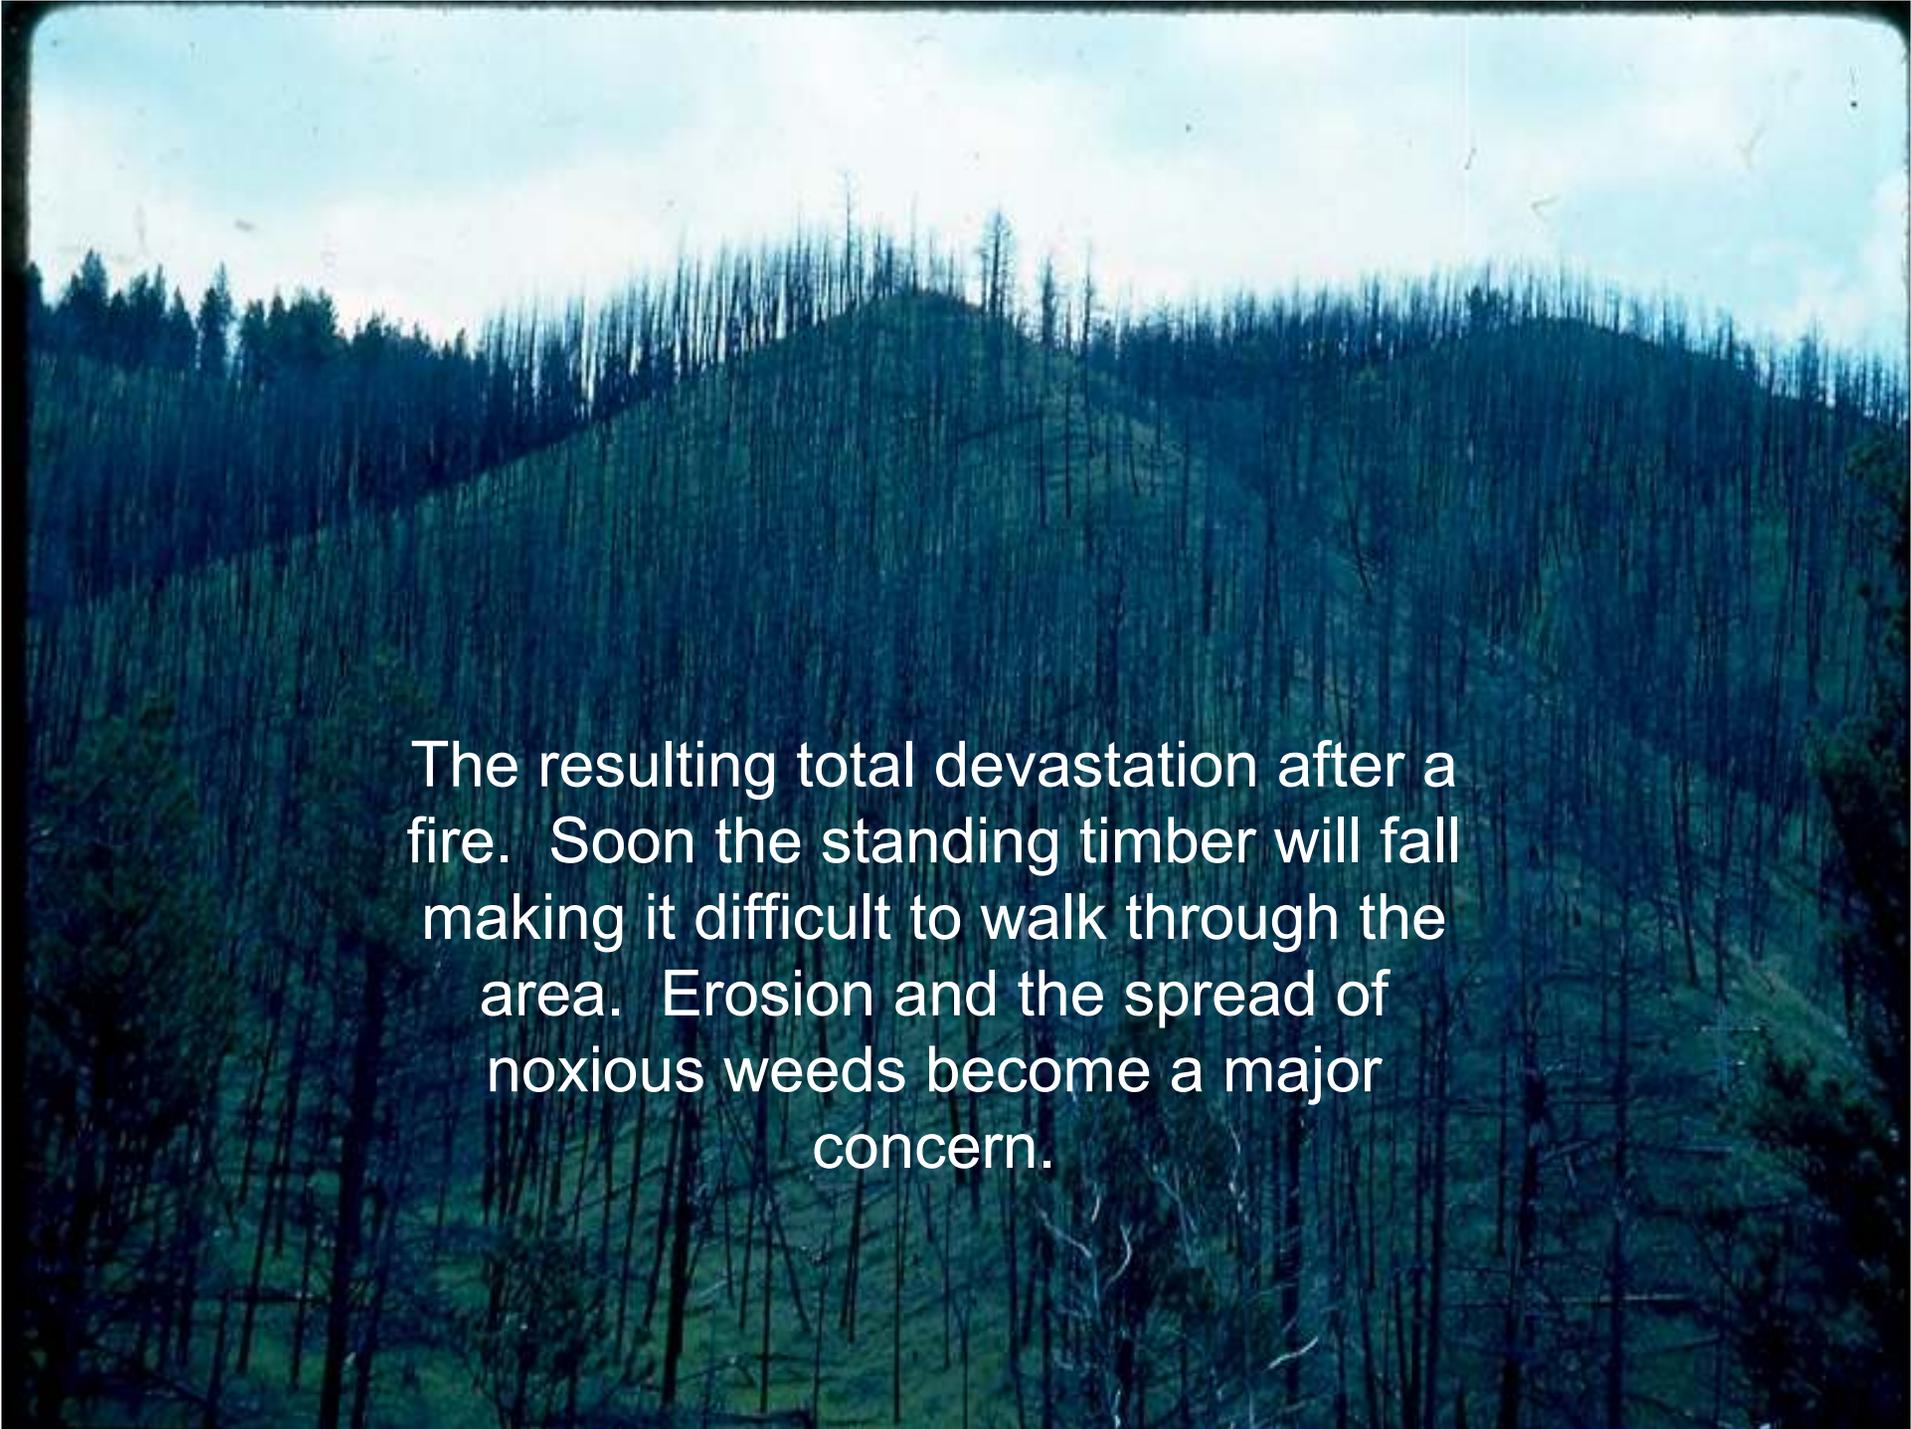

Soon after dying the trees will begin to fall.

The forest then becomes uninhabitable for many animals that once lived there.

In our climate these fallen trees may take a hundred years to completely decompose.

The resulting total devastation after a fire. Soon the standing timber will fall making it difficult to walk through the area. Erosion and the spread of noxious weeds become a major concern.

FIRE BEHAVIOR POTENTIAL

USING THE FOLLOWING ACTUAL FORECASTS, ACTUAL WEATHER, & ACTUAL FUEL MOISTURE READINGS FROM THE HELENA FIRE WEATHER STATION – THE FOLLOWING FIRE BEHAVIOR POTENTIAL IS CALCULATED.

NWS

FIRE WEATHER FORECAST

AUGUST 8, 2006

Temp. : 88° - 97°

R/H : 15 – 23%

WIND :

Lower elev.: S 5 – 15 mph

Ridge Top: SW 10 -15 mph

RED FLAG WARNING

DRY T-STORMS WITH GUSTY SW WINDS SHIFTING MORE NORTHERLY, DUE TO APPROACHING COLD FRONT. GUSTS CAN EXCEED 20 mph NEAR T-STORMS.

AUGUST 29, 2006

Temp. : 85° - 94°

R/H : 11 – 17%

WIND :

Lower elev.: S 5 – 15 mph

Increasing to SW 15 – 25 mph

Ridge Top: SW 20 - 30 mph

RED FLAG WARNING

DRY T-STORMS WITH GUSTY SOUTH WINDS SHIFTING TO THE WEST DUE TO APPROACHING COLD FRONT.

NWS OBSERVATIONS **ACTUAL HELENA WEATHER**

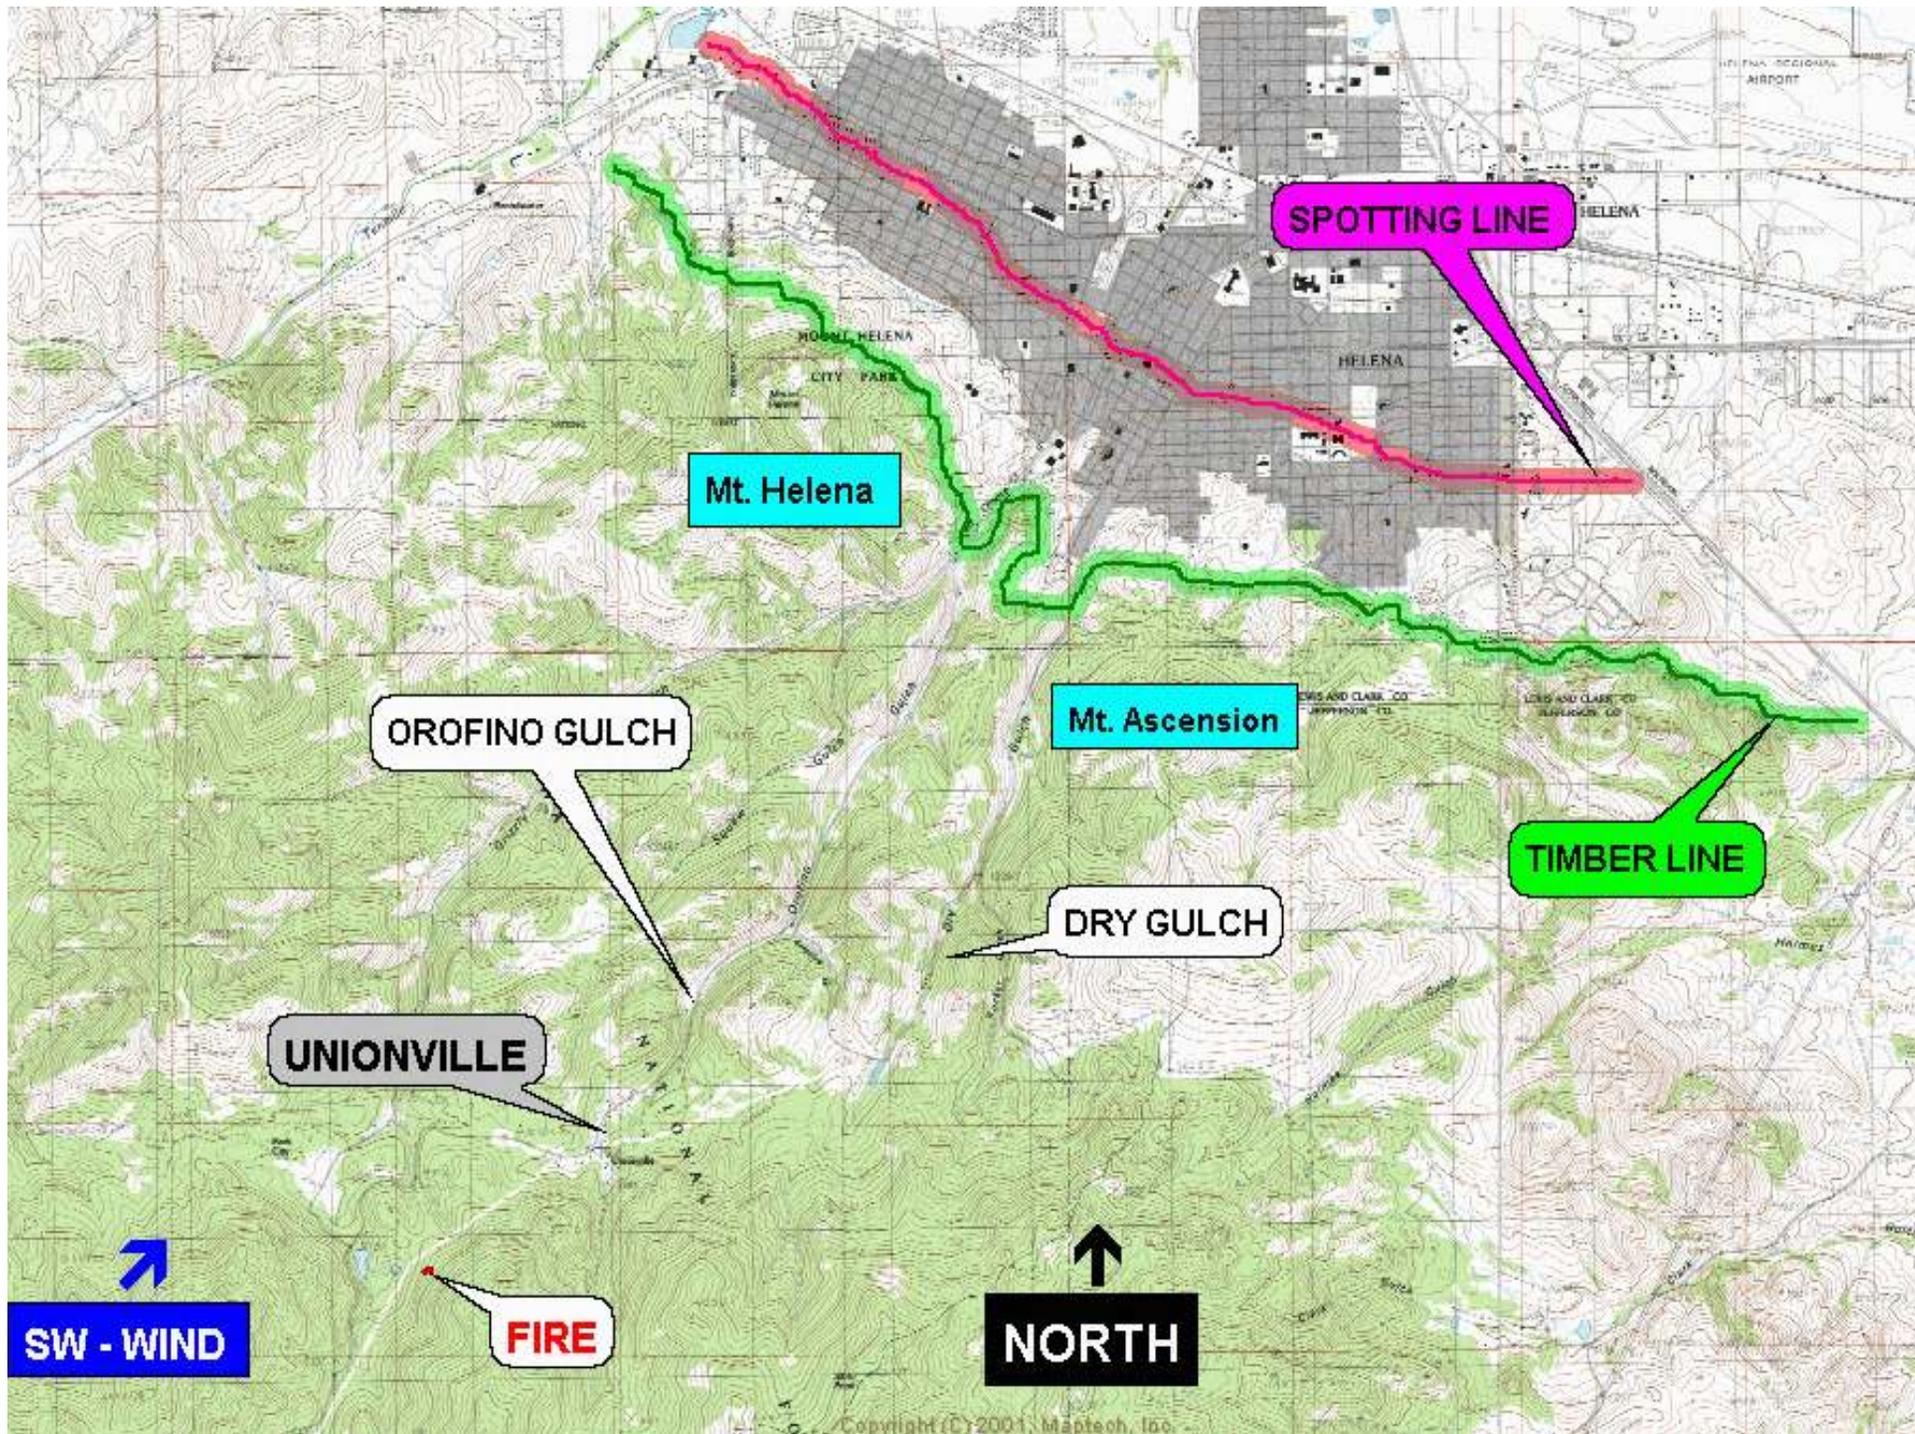

AUGUST 8, 2006

- Max. Temp. = 91°
- Min. R/H = 9%
- WIND 10 TO 28 mph
from 2pm to 6pm
- Gusts to 49 mph

AUGUST 29, 2006

- Max. Temp. = 94°
- Min. R/H = 9%
- WIND 21 TO 23 mph
from 2pm to 5pm
- Gusts to 37 mph

Based on this information a model fire has been created to show the behavior of a fire starting at a point just South West of Unionville at 12 pm.

A photograph of a forest landscape. The foreground is filled with lush green trees and bushes. In the middle ground, a large, bare tree stands prominently. The background shows a dense forest with a mix of green and brown trees, suggesting a fire or a transition in vegetation. The sky is bright and clear.

The fire started in fuels and terrain just like this

FUEL DESCRIPTIONS HAVE BEEN MODIFIED
TO ADDRESS THE MOUNTAIN PINE BEETLE EPIDEMIC

- The following table compares the key elements of the fire behavior calculations between green live trees and red/dead trees using the same weather.

	<u>SURFACE FIRE</u>		<u>CROWN FIRE</u>	
	ROS	Flame length	ROS	Flame length
Green/Live	20 ch/h	9 ft.	100 ch/h	130 ft.
Red/Dead	25 ch/h	10 ft.	124 ch/h	140 ft.

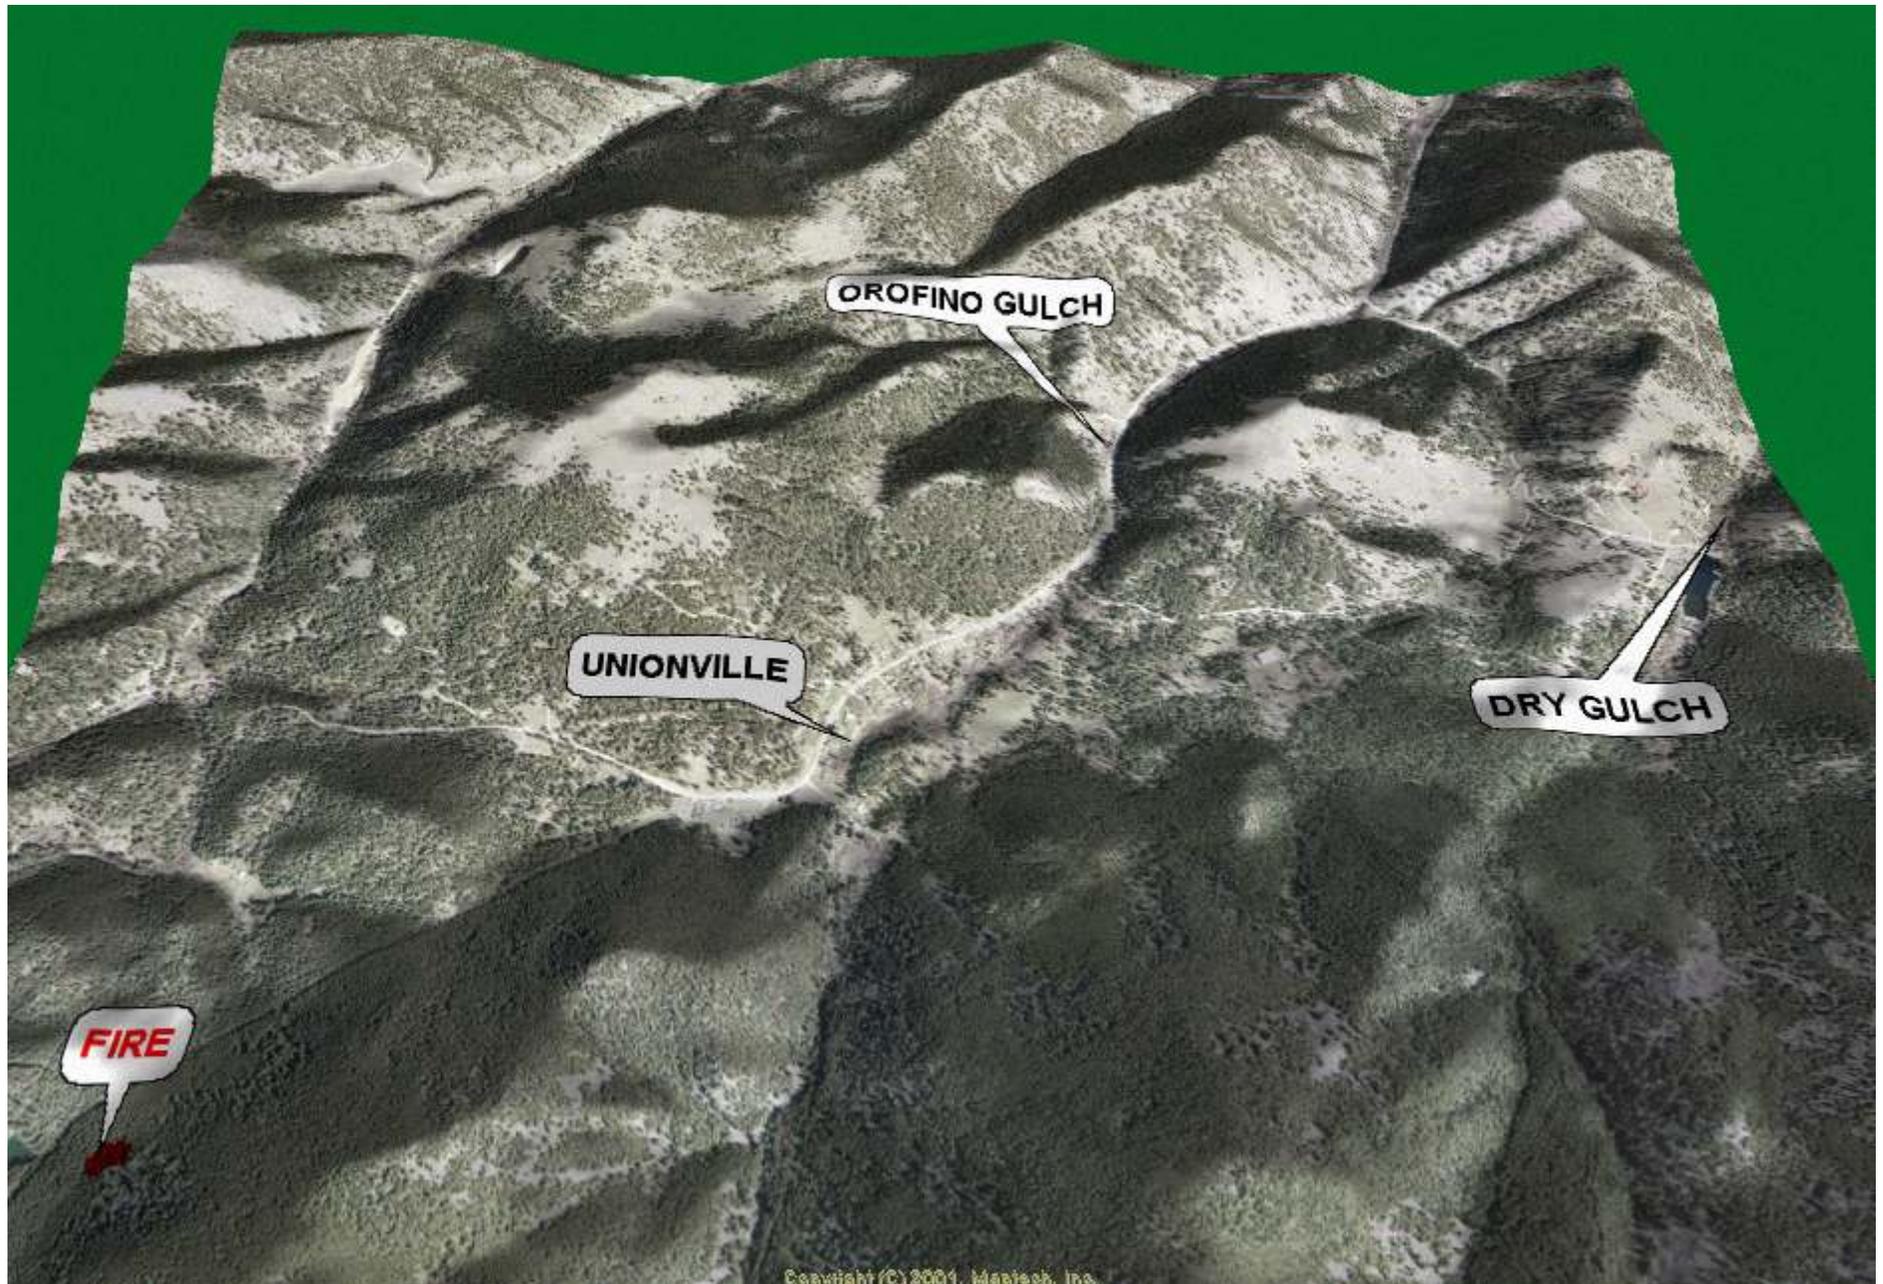

Both live and dead transition to a crown fire under these weather conditions and remain an active crown fire with a 20 mph 20 foot wind.

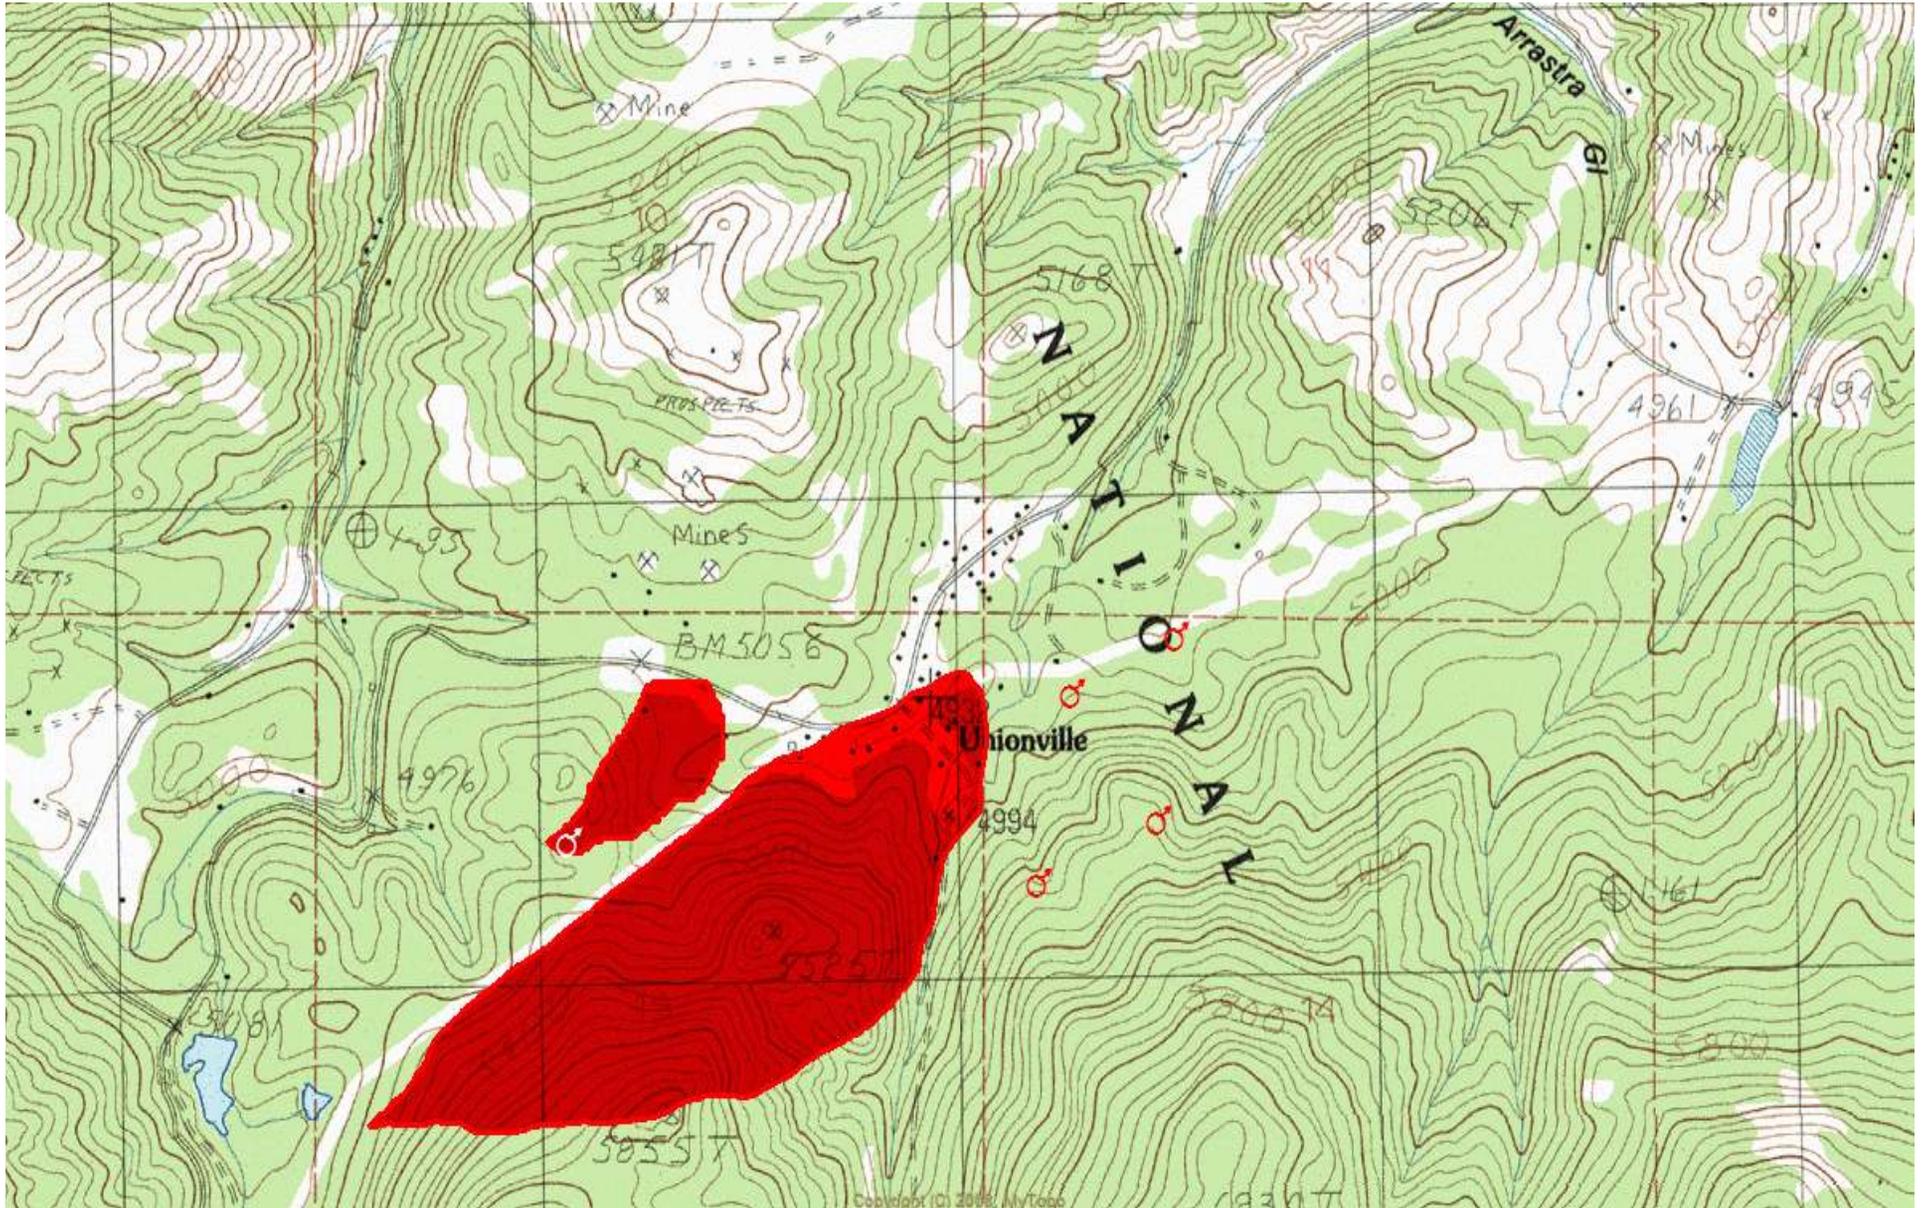

FIRE SUPPRESSION INTERPRETATIONS

- Crown fires can be extremely dangerous and unpredictable.
- The safety of **firefighters and civilians** in the vicinity of a crown fire can be compromised.
- Most fire suppression activity in the event of a crown fire involves evacuation with very little effective fire suppression.

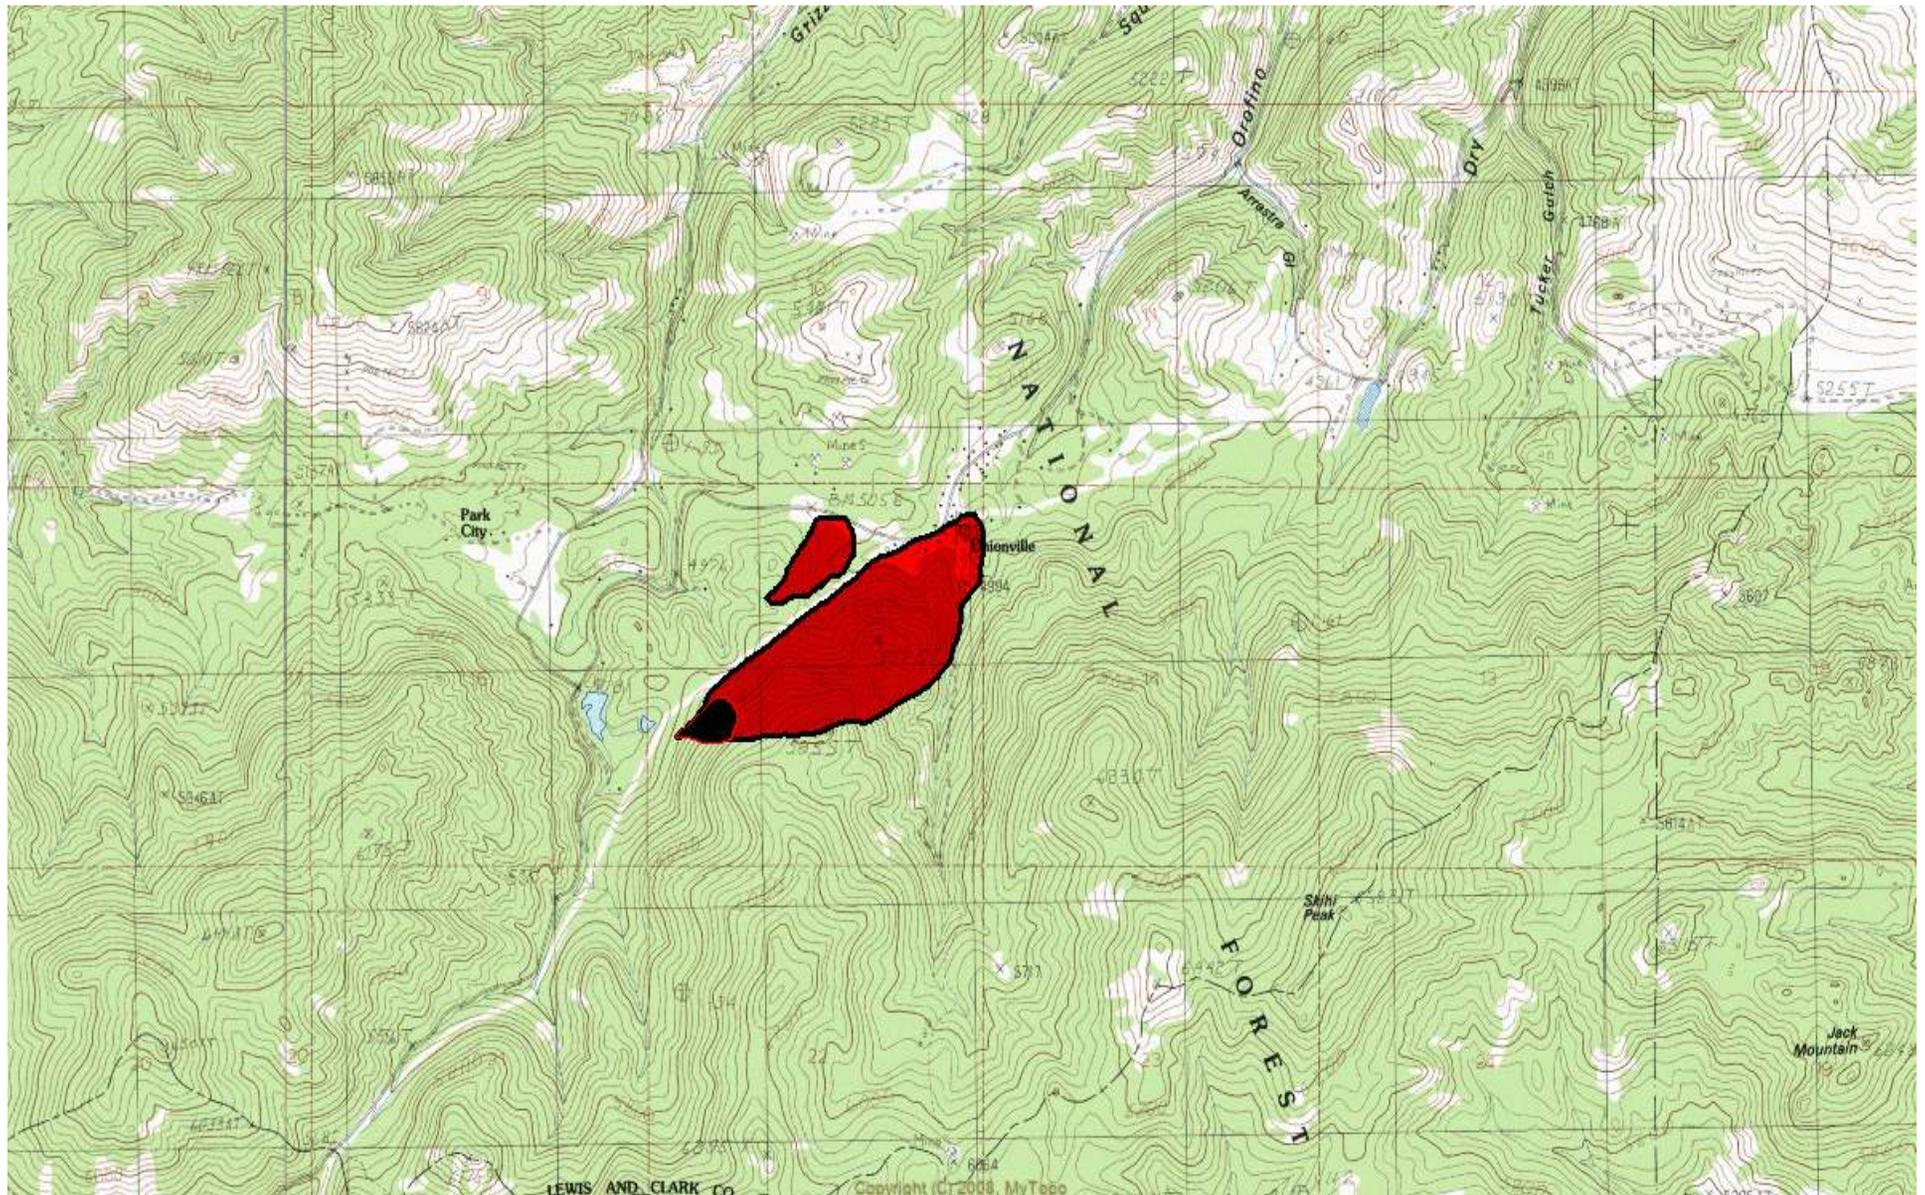

FIRST HOUR 12:00 P.M. – 1:00 P.M.

First Hour 12:00 – 1:00pm +/- 180 acres

Black Indicates Pre-Epidemic Fire Perimeter in One Hour +/- 8 acres

The fire would make a rapid crowning run up the steep slope from it's origin.

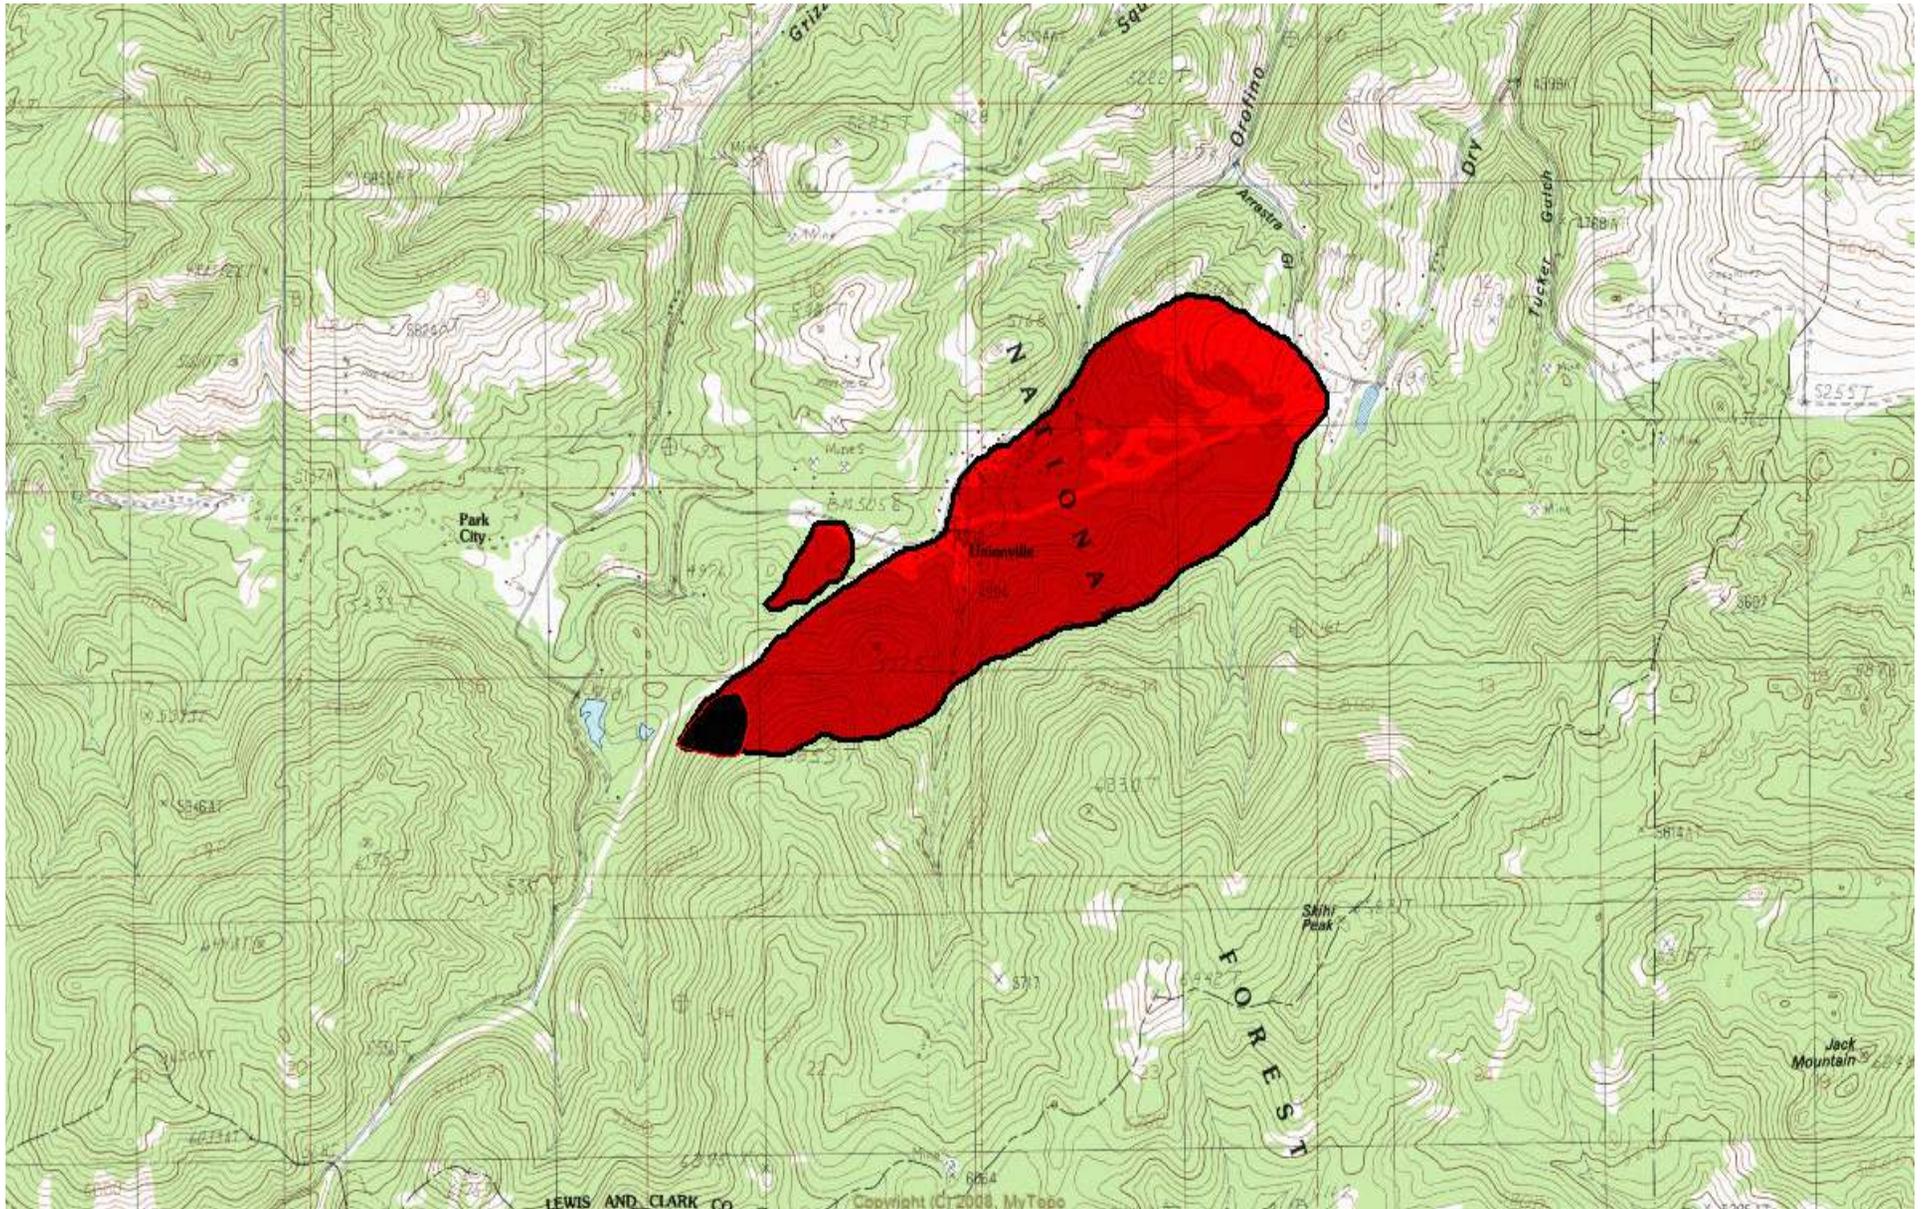

Catching the full force of the wind at the ridge top would drive the fire rapidly to the northeast.

Fire would move to the northeast with advancing fire front and spotting

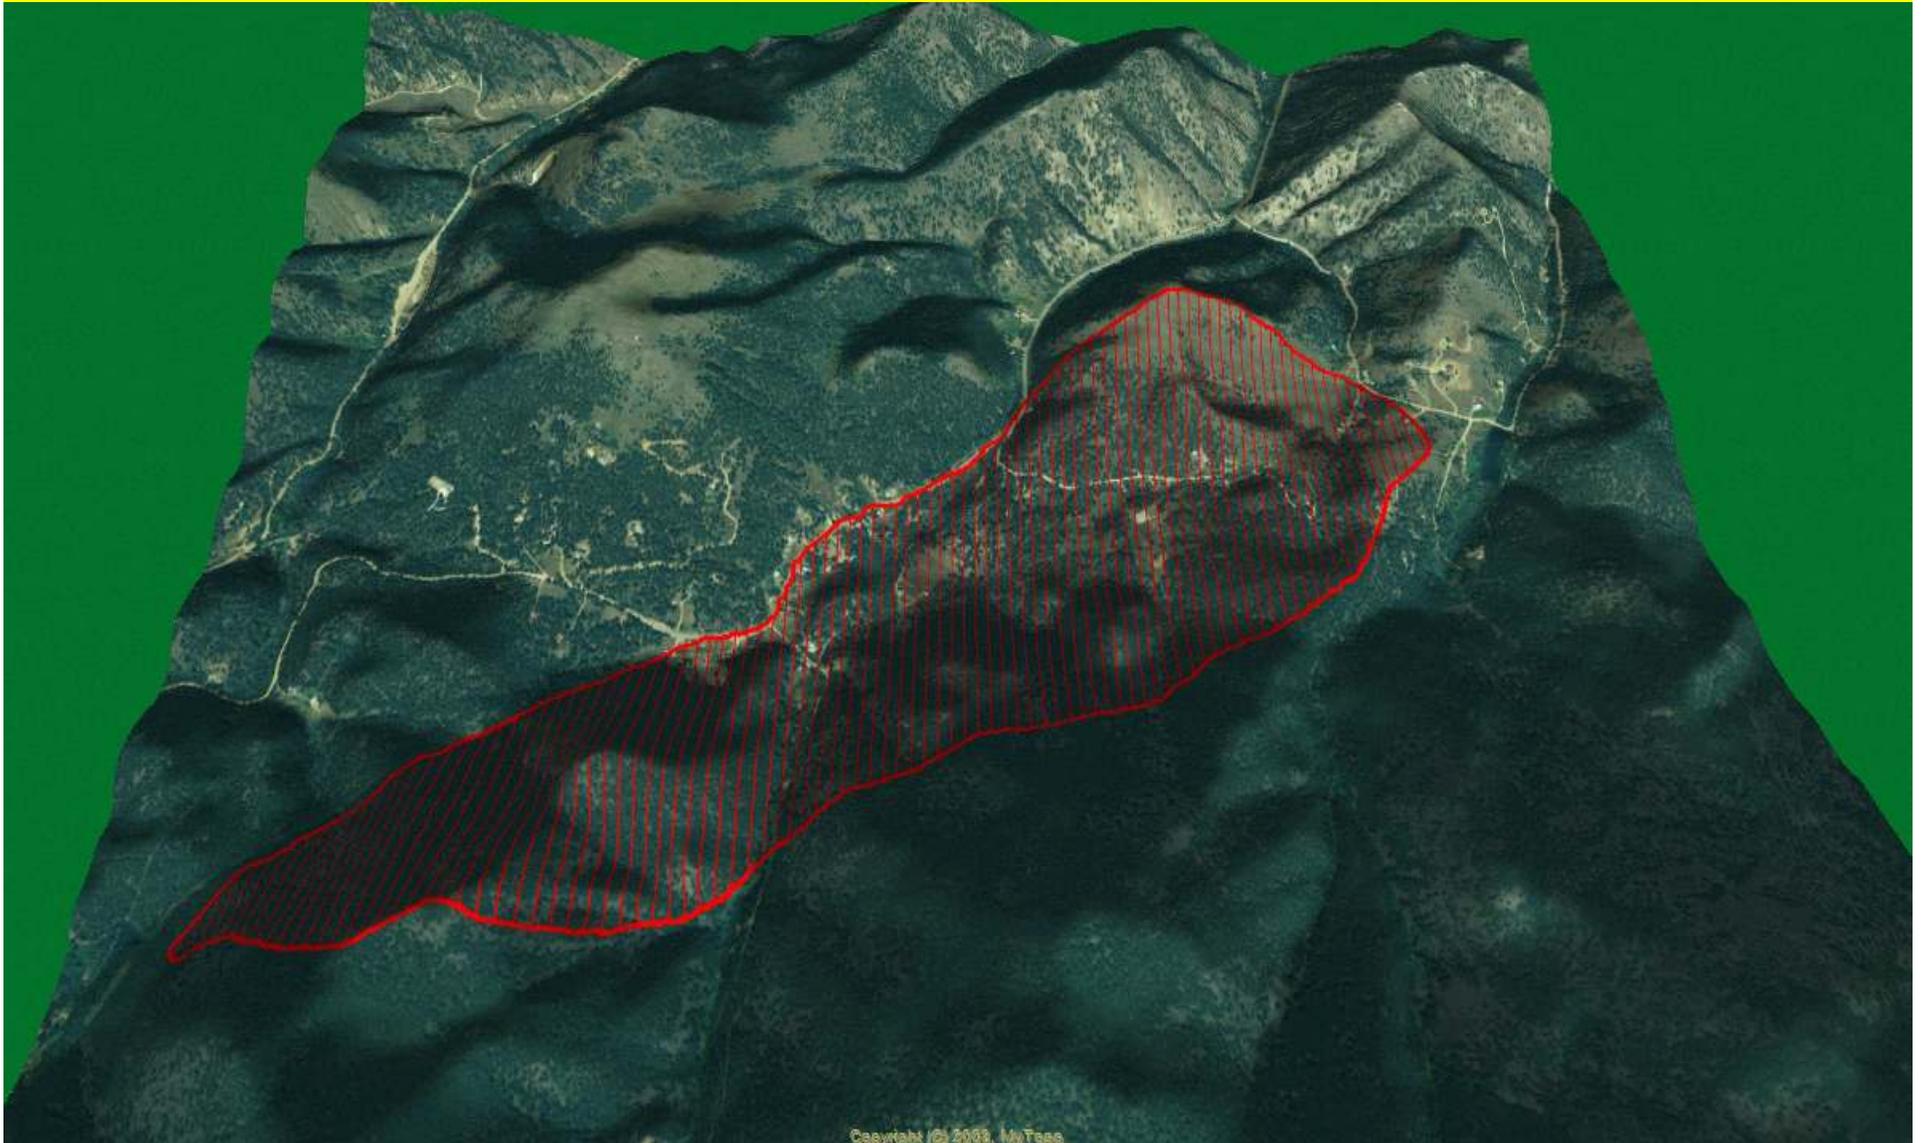

Black Indicates Pre-Epidemic Fire Perimeter in Two Hours +/- 14 acres

- The fire spread **assumes** fire fighting crews would hold the fire south and east of the Orofino Gulch road near the small town of Unionville maintaining an escape route for local residents.

The Fire has consumed most of the Unionville Area

A scenic landscape photograph of Unionville. In the foreground, there is a grassy hillside with a paved road curving through it. Several houses are visible, including a prominent blue house with a brick chimney and a white house. The middle ground is filled with lush green trees. In the background, a large, forested hill rises under a sky with scattered white clouds. The word "UNIONVILLE" is overlaid in white capital letters in the center of the image.

UNIONVILLE

FIRE BEHAVIOR CALCULATION

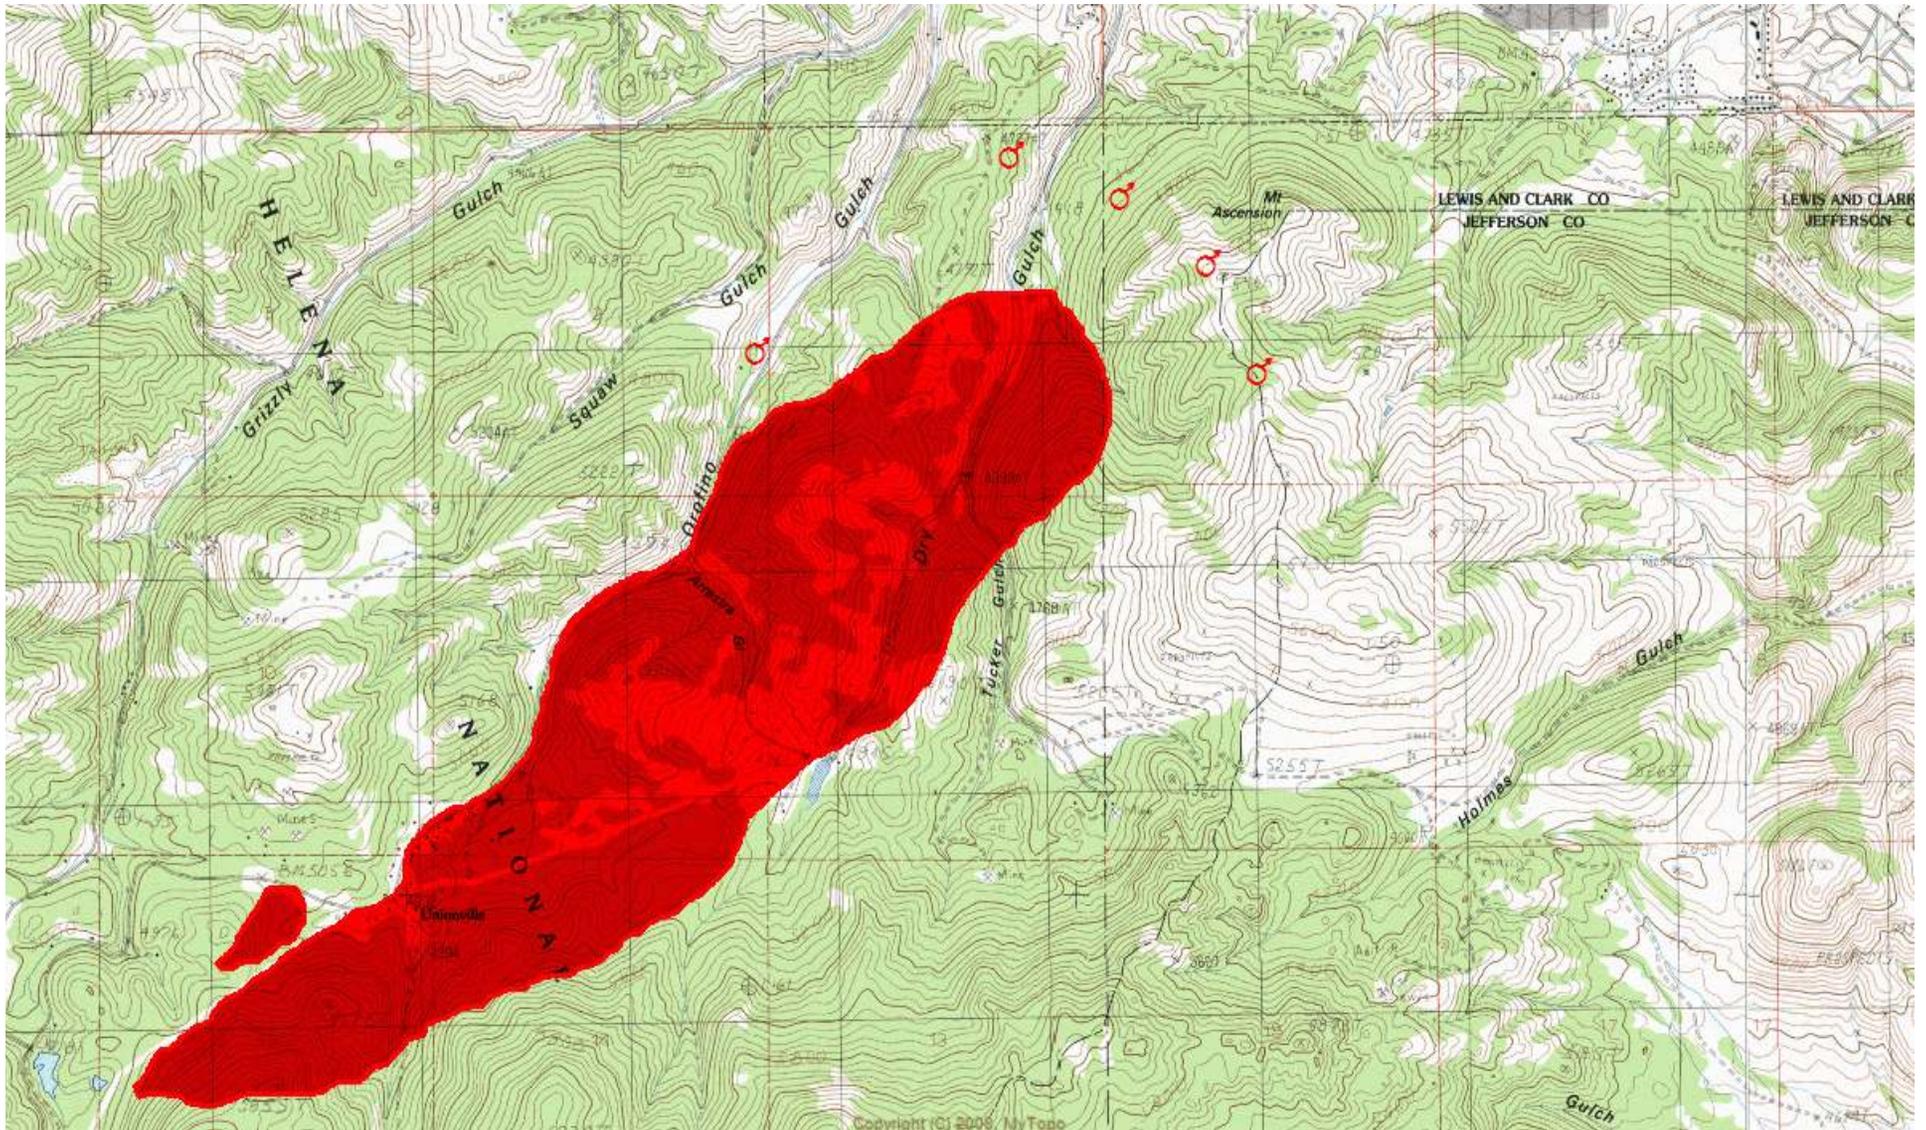

2:00 P.M. TO 5:00 P.M.

- **ACTIVE CROWN FIRE MOVING AT AN AVERAGE OF 1.6 MPH.**
Fire would reach the Helena City Limits in 2 more Hours (by 4pm).
- **SPOTTING UP TO .5 MILE AHEAD OF THE MAIN FIRE.**
Hot embers would be raining down on homes within the City Limits by 4pm.
- **PROBABILITY OF IGNITION FROM SPOTTING IN RECEPTIVE FUELS IS 98%.**

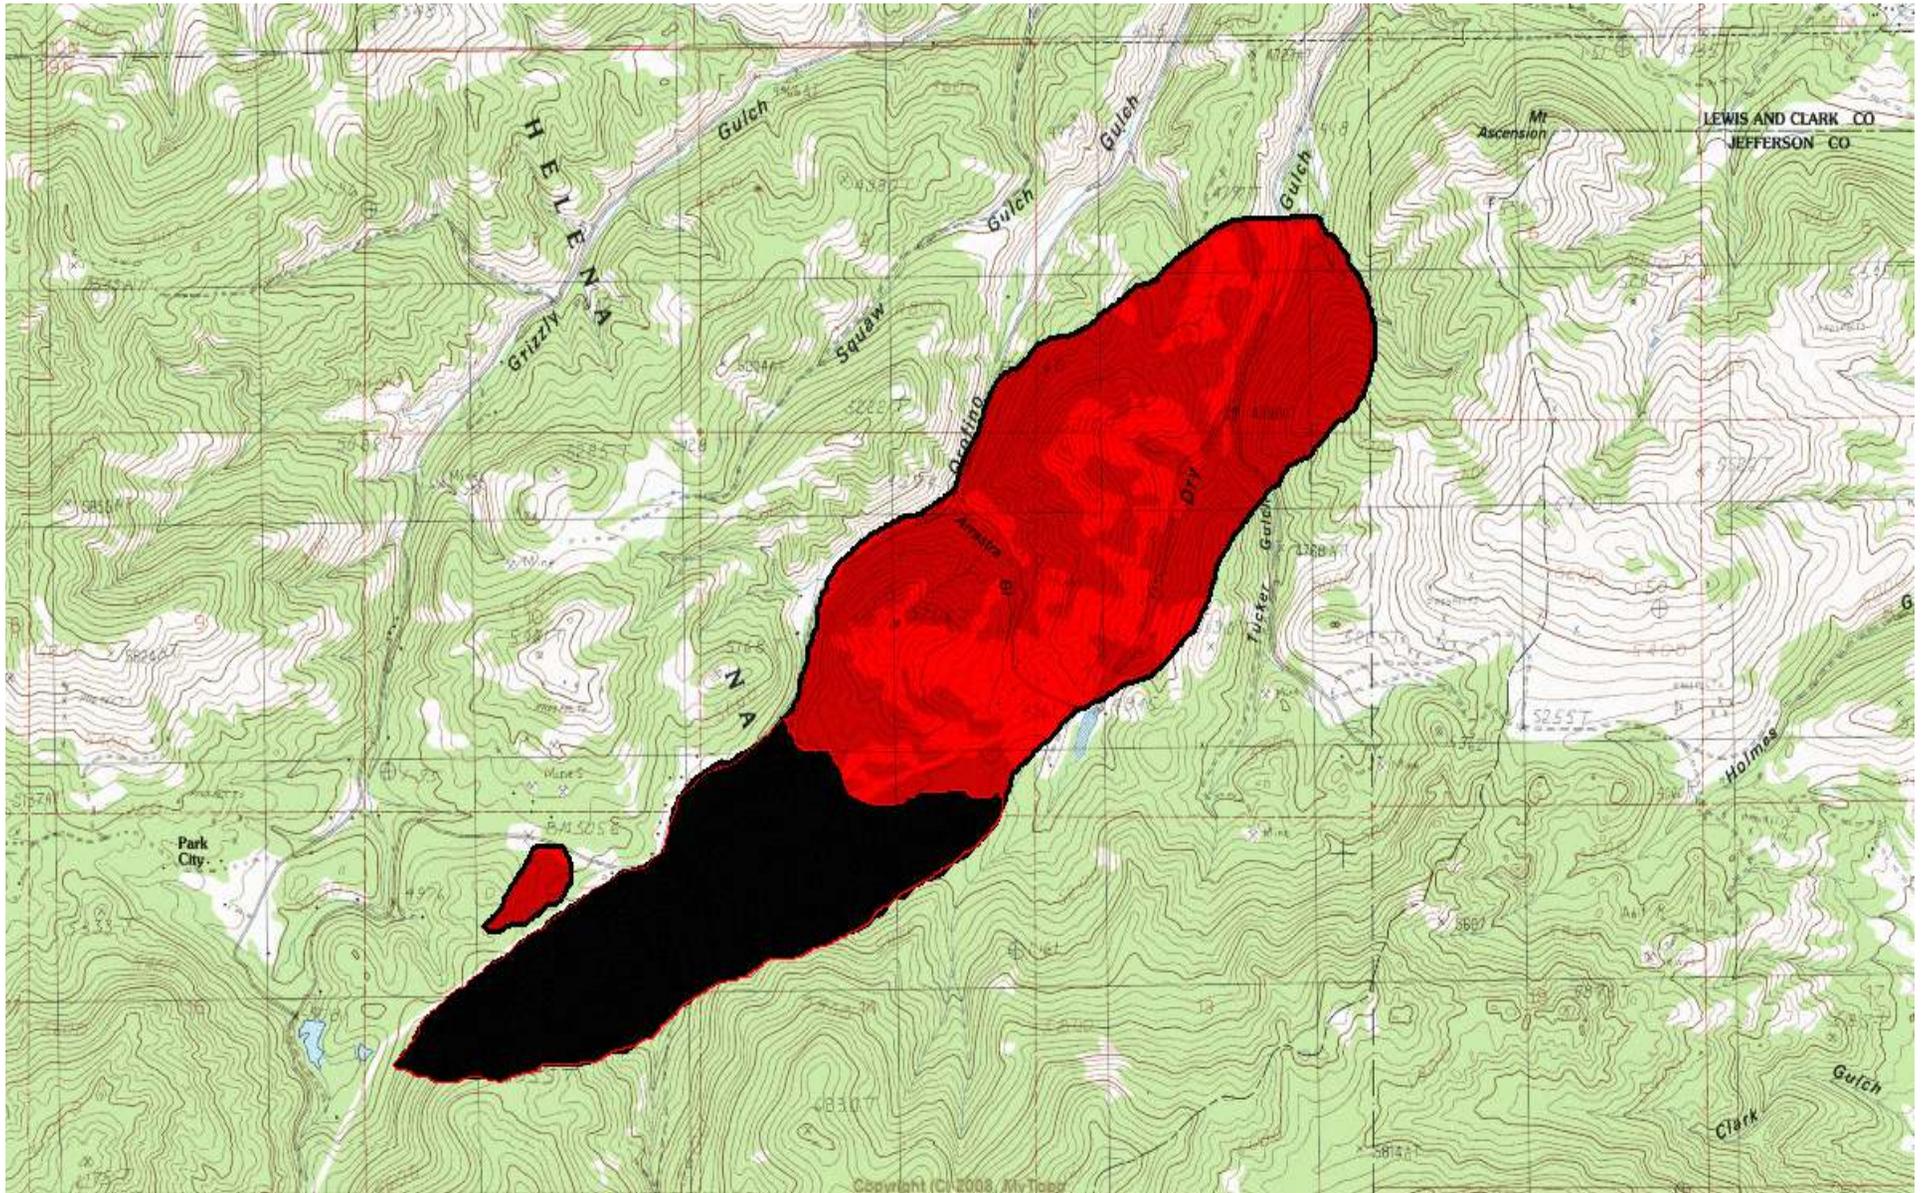

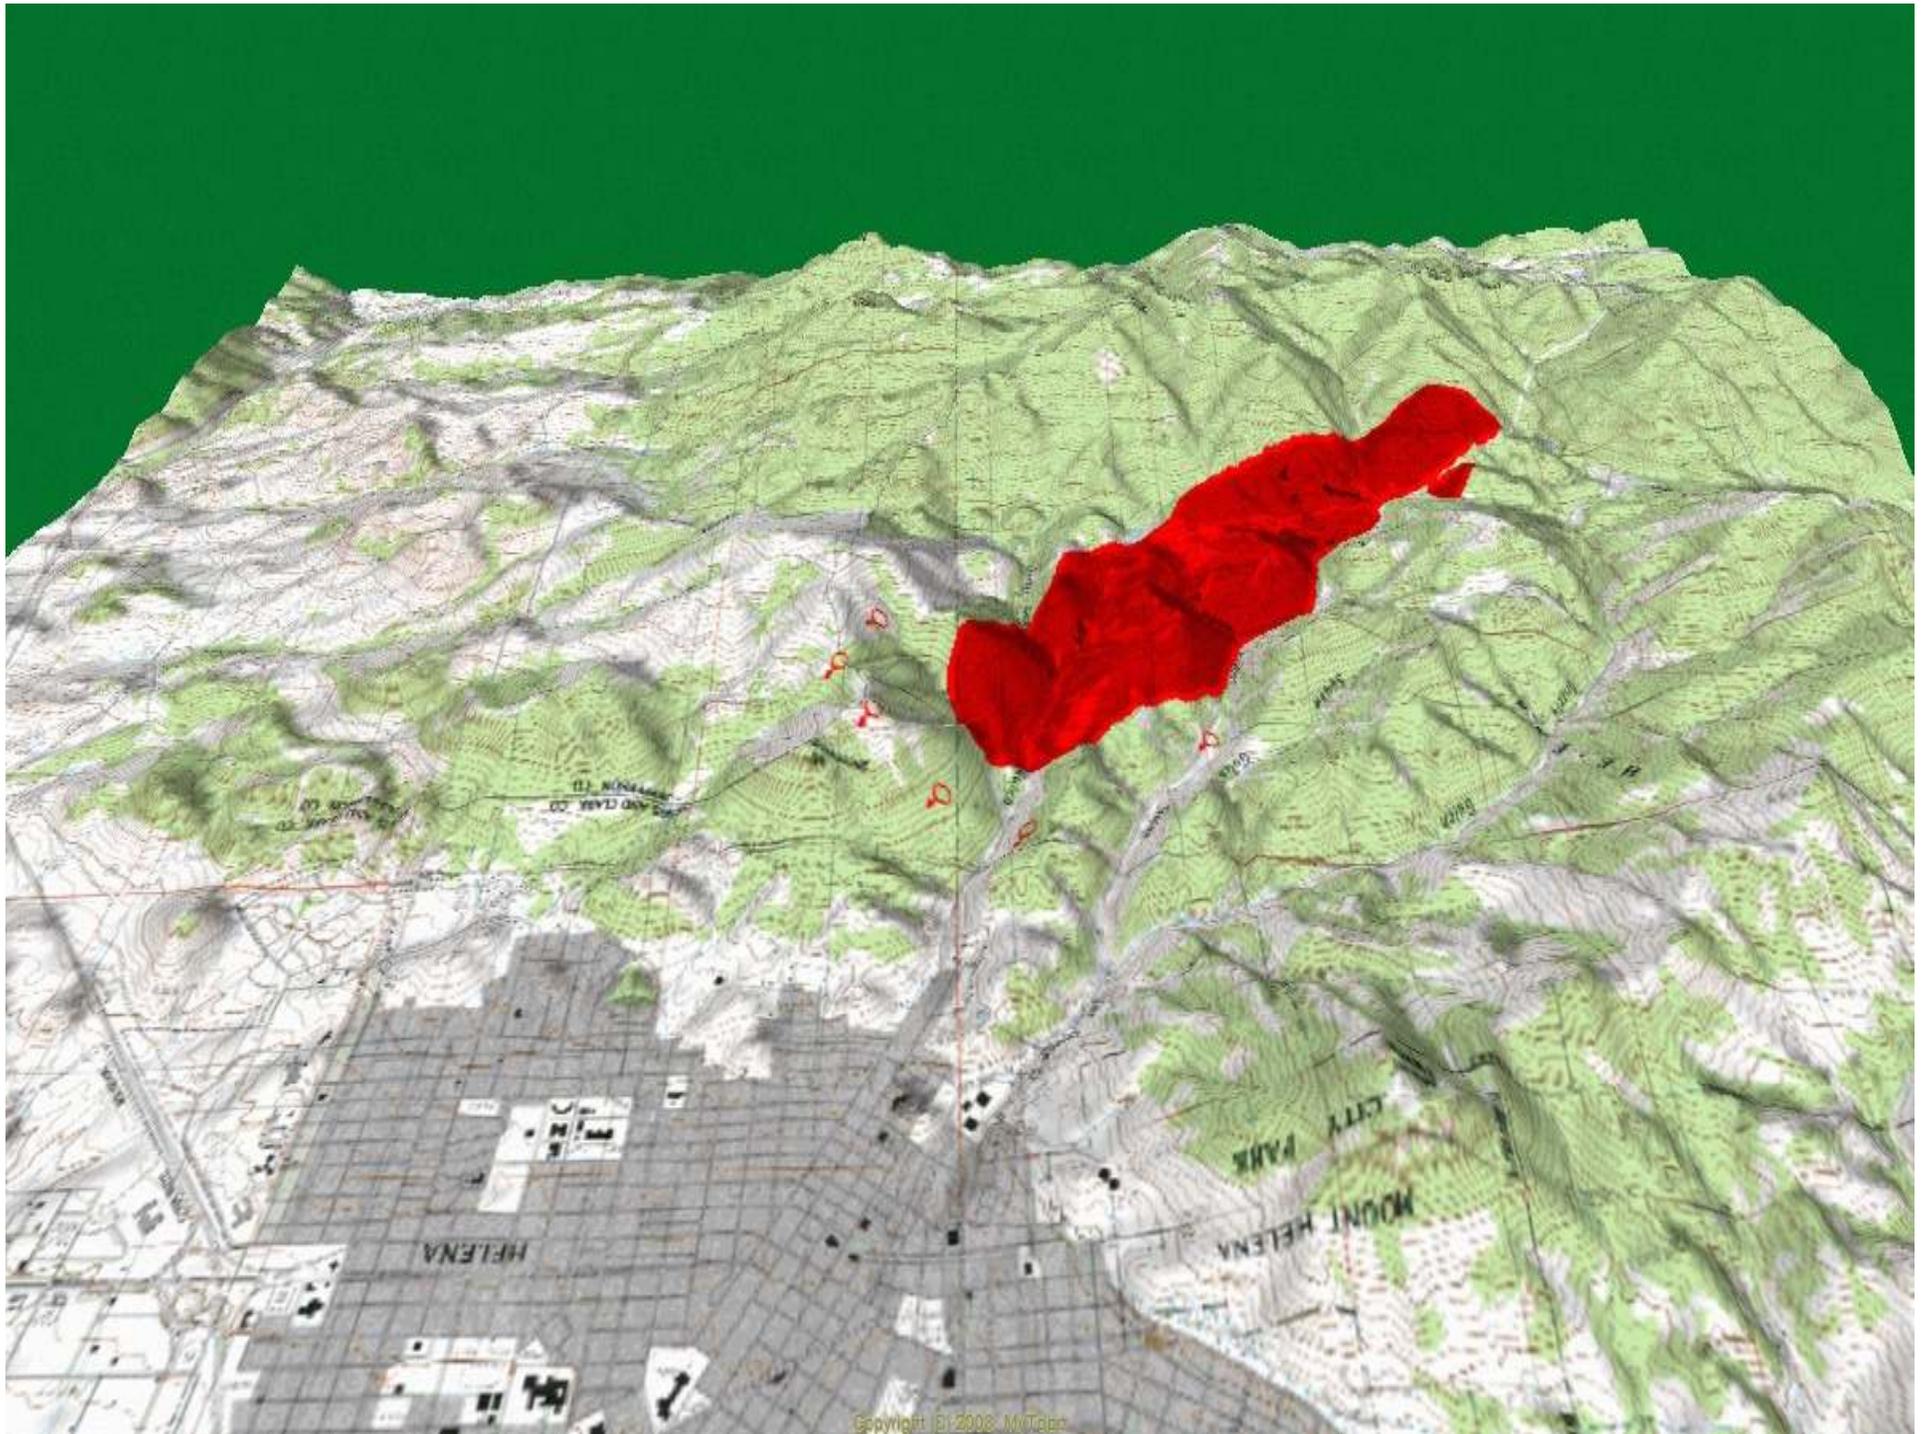

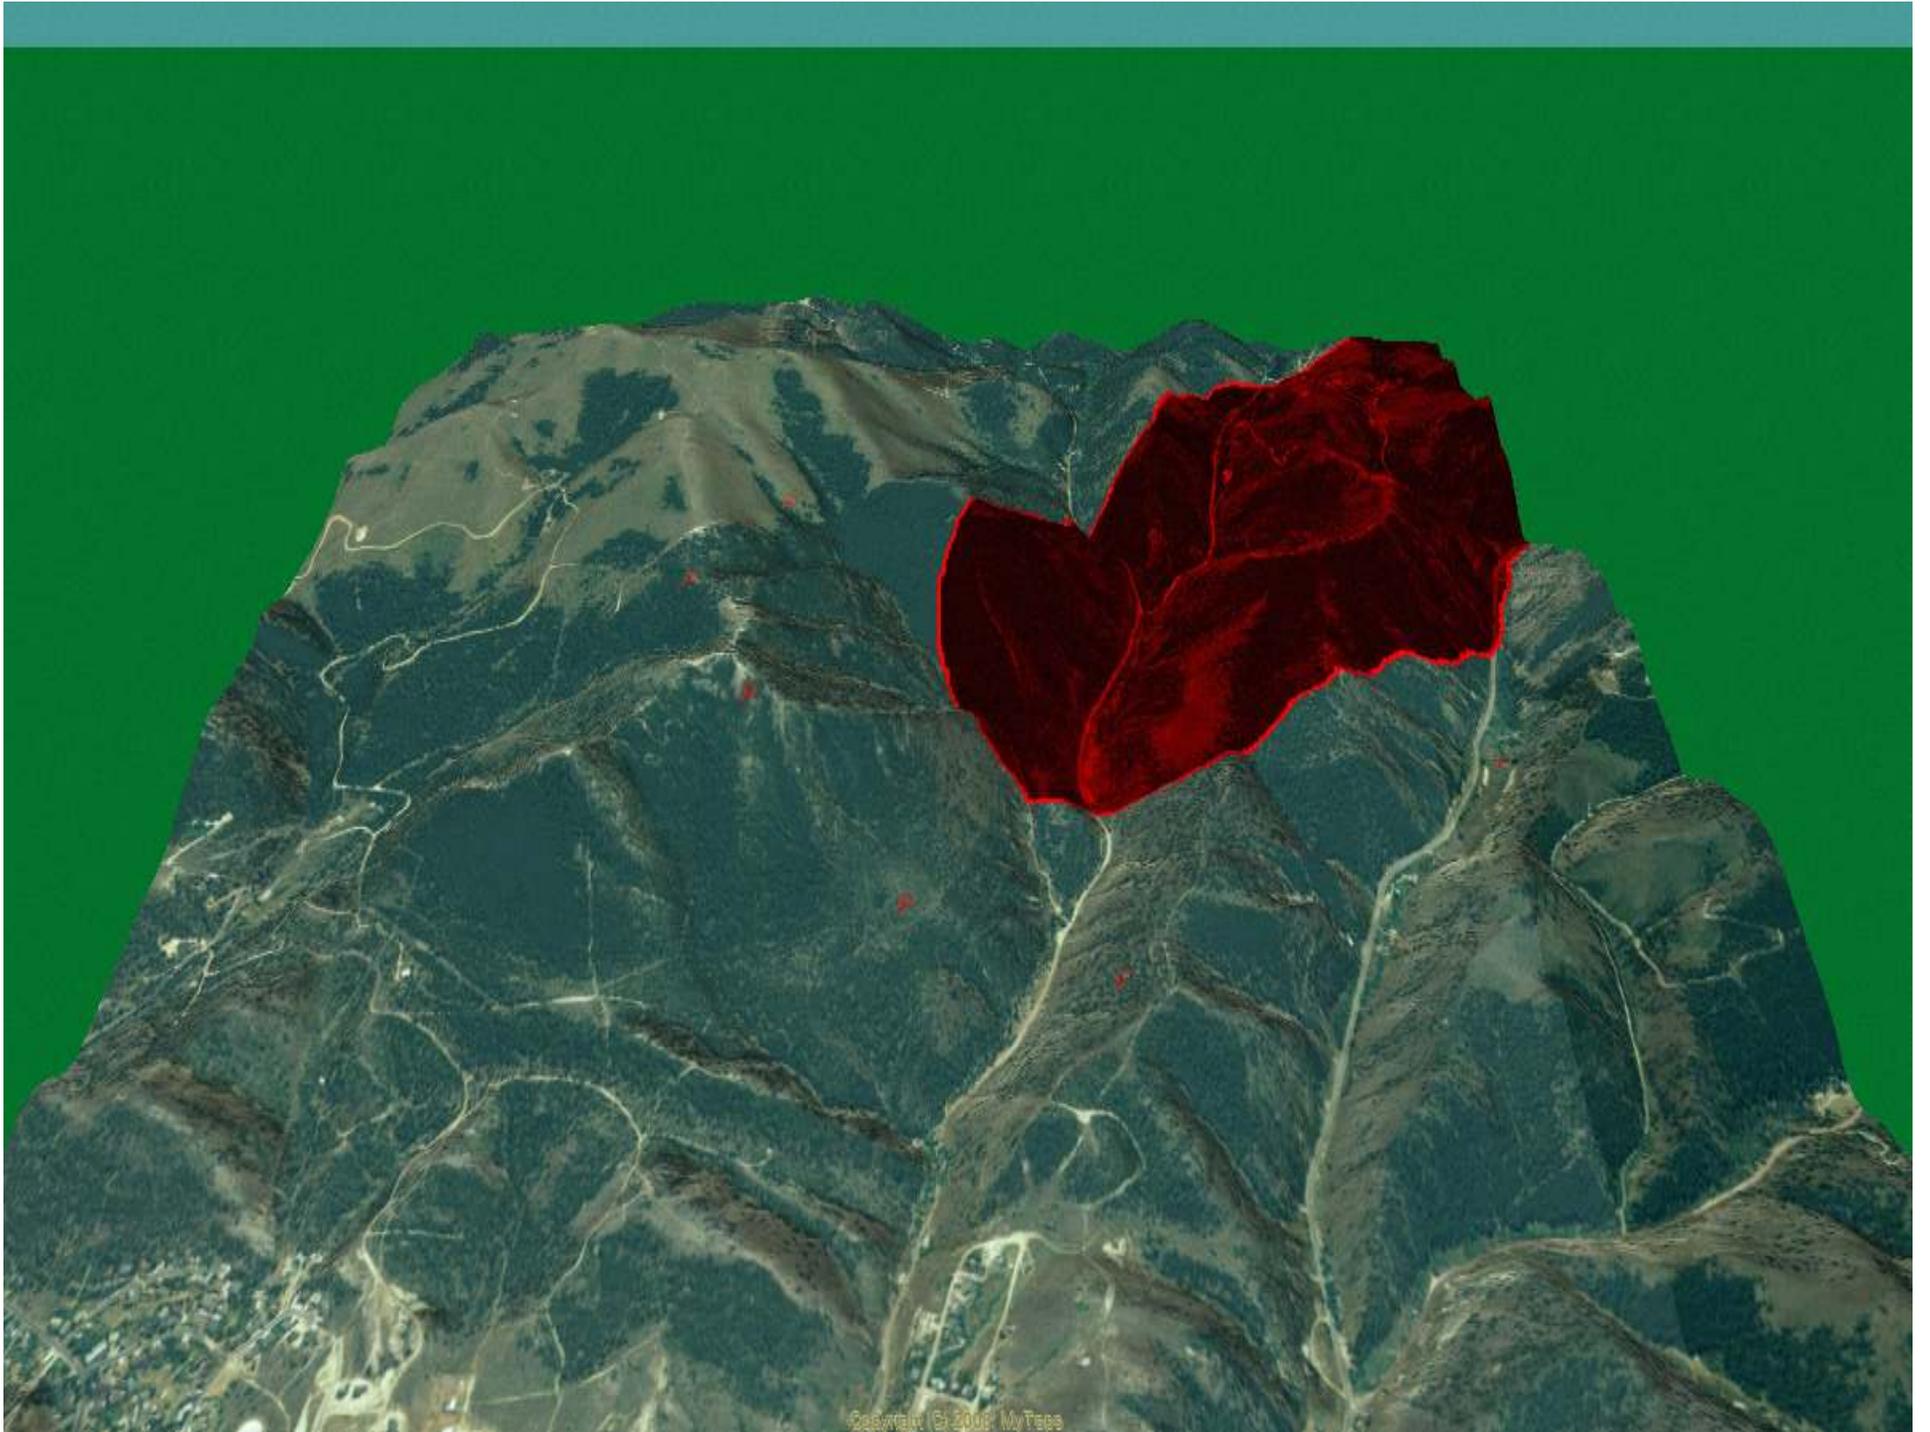

Third Hour 2:00 -3:00pm
+/- 1,280 acres

Black Indicates Pre-Epidemic Fire Perimeter in Three Hours +/- 420 acres

Home and human survival would depend entirely upon **Firewise** home construction, defensible/survivable space, fuel breaks, escape routes and safety zones.

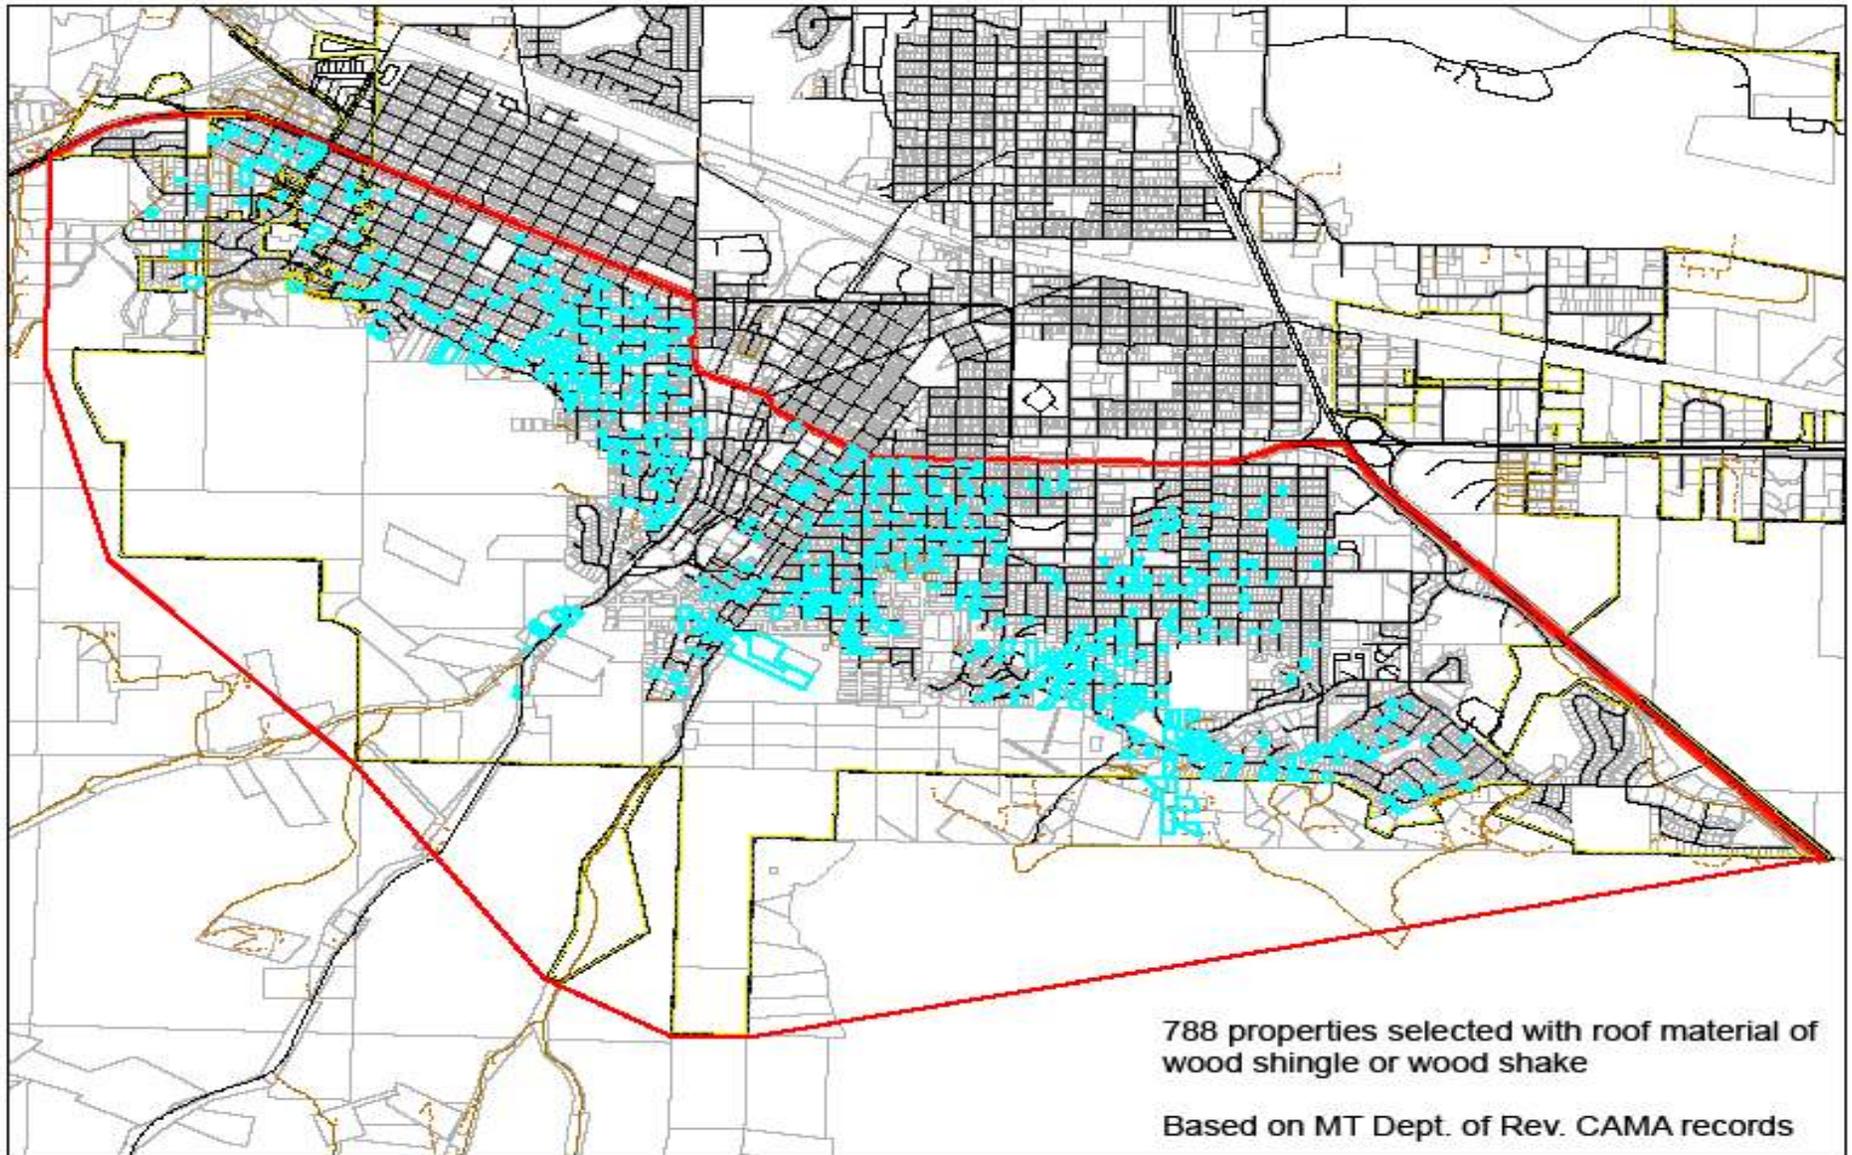

A large fire at night, with a city in the foreground. The fire is bright orange and yellow, with a large plume of dark smoke rising into the sky. The city lights are visible in the foreground, and the fire is in the background. The text is overlaid on the fire.

Hot embers would be raining down onto homes up to .5 miles ahead of the fire front.

Map of shake shingle roofs

Homes with Wood Shingle type roofs are at a greater risk to catch fire than that of an asphalt or fire restive material

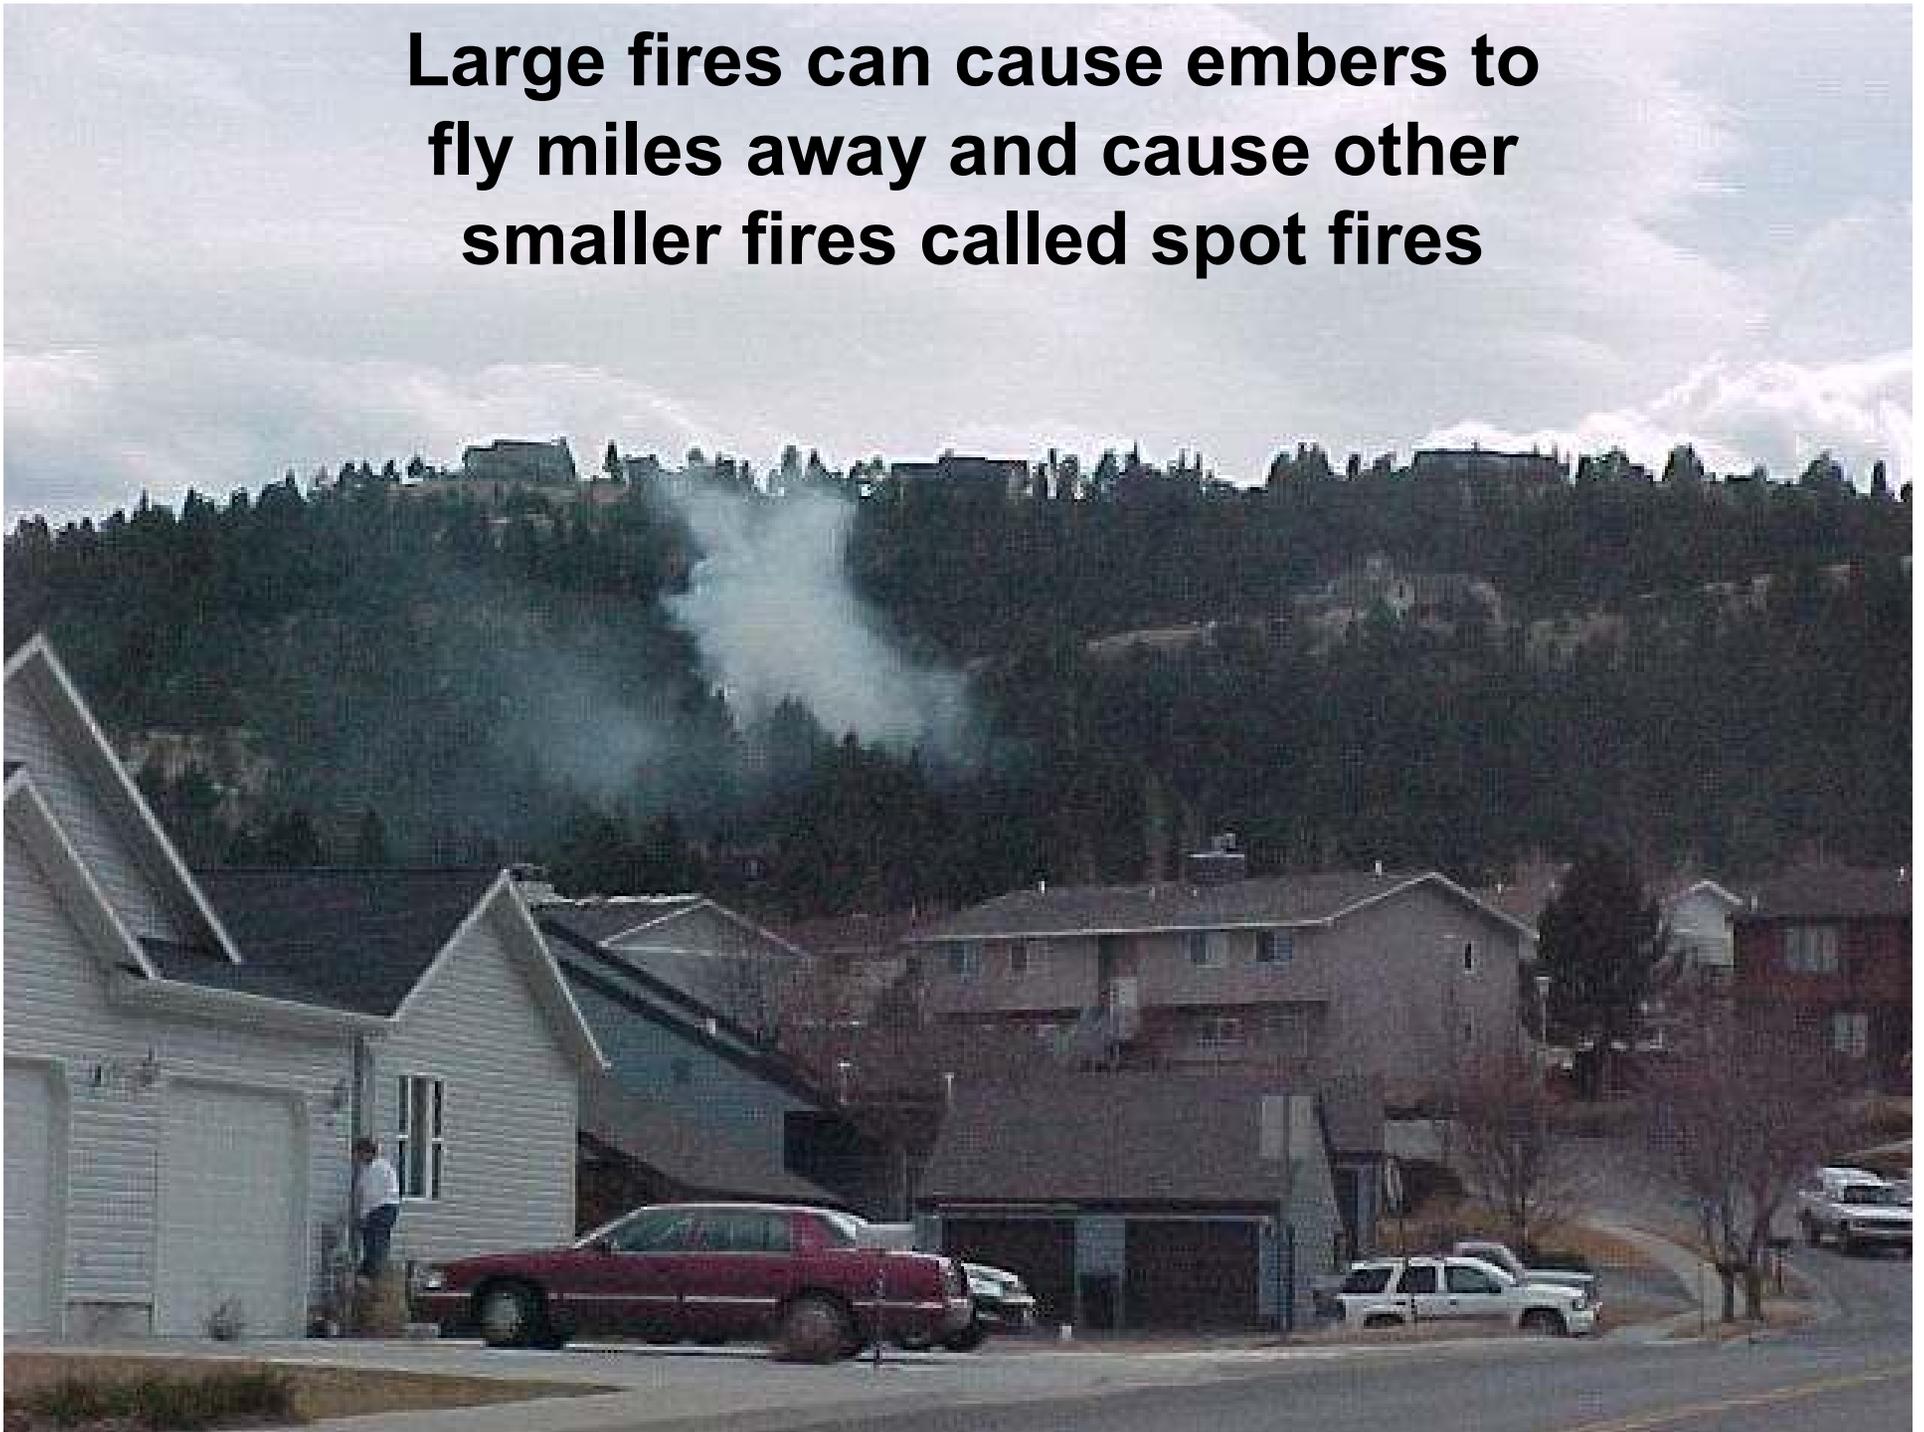

Fourth Hour 3:00 – 4:00pm
Fire Enters Helena City Limits
+/- 3190 acres

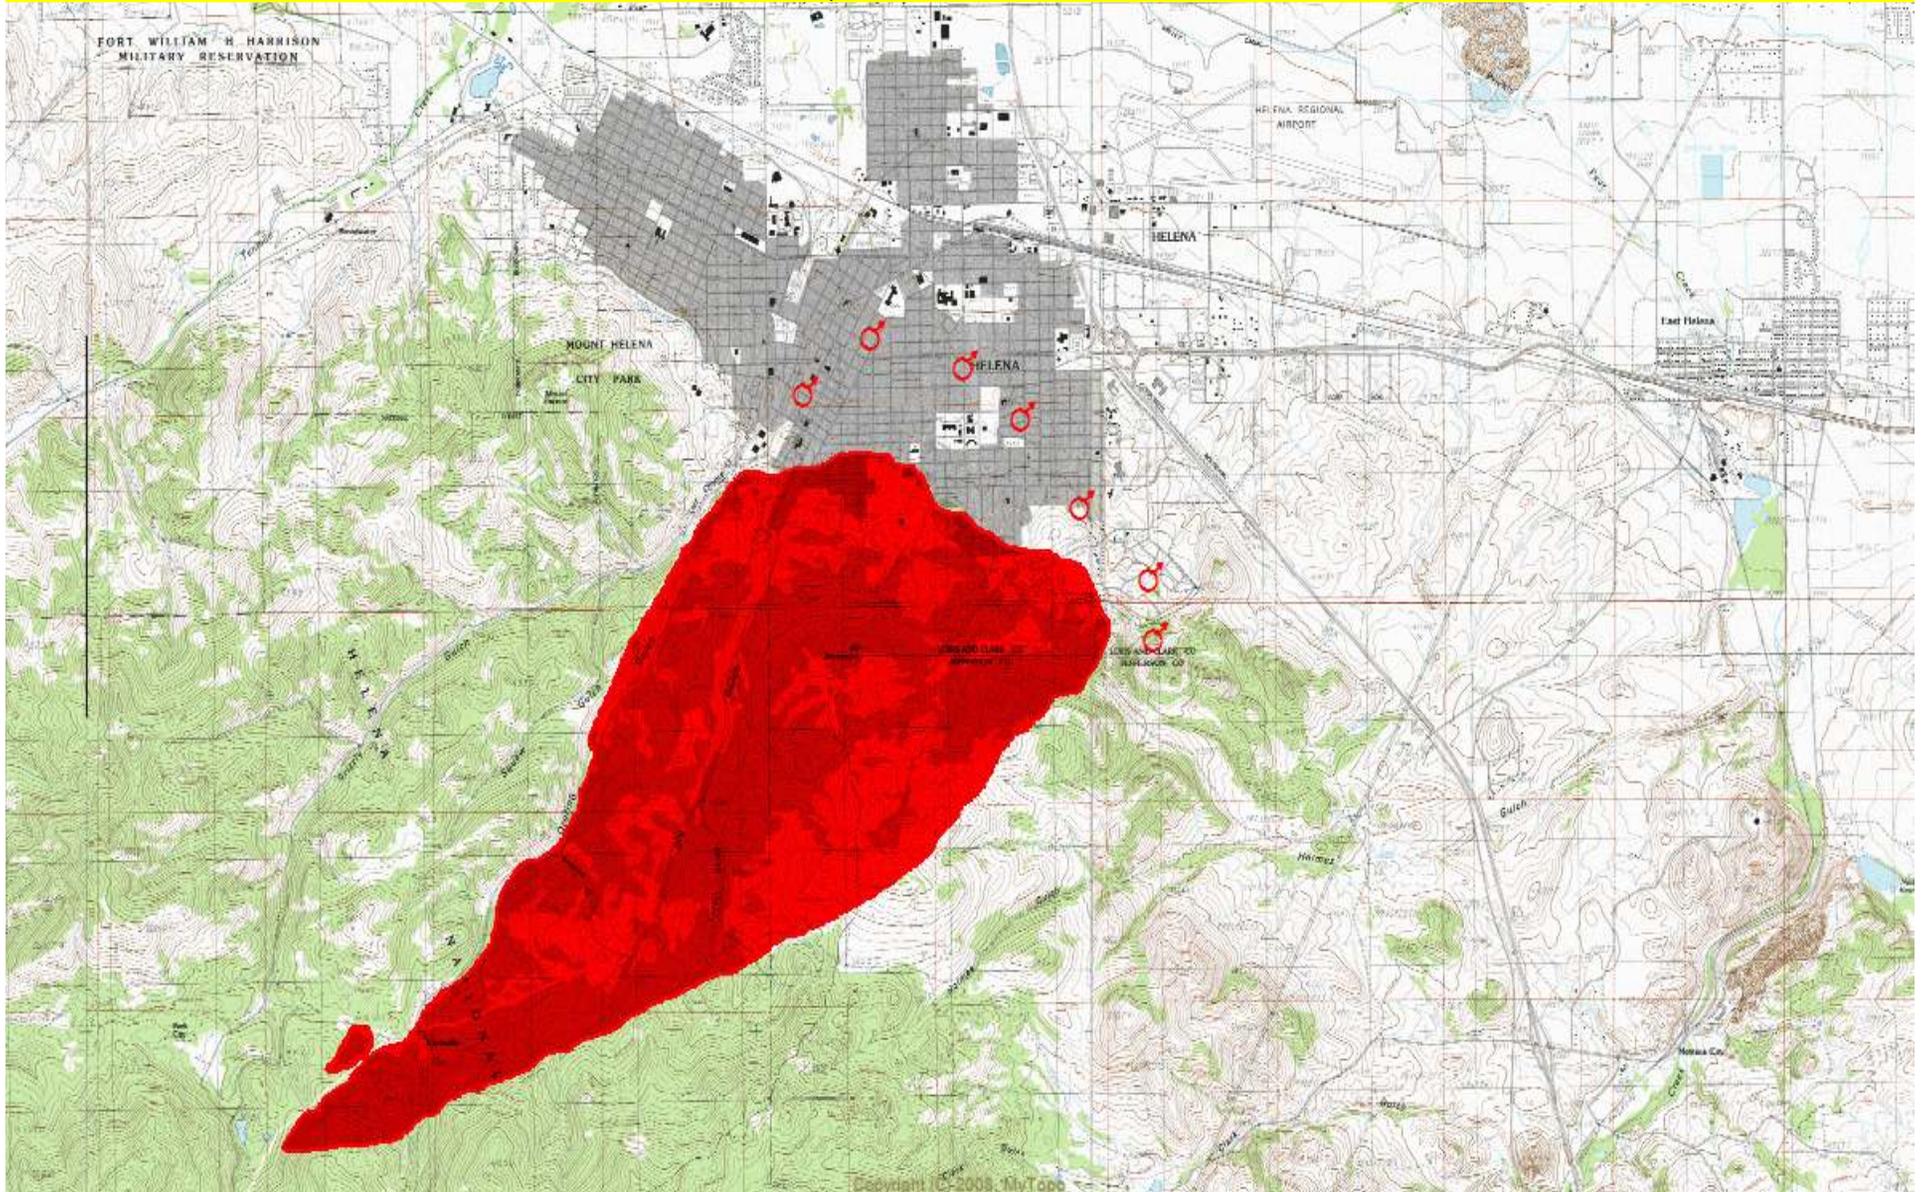

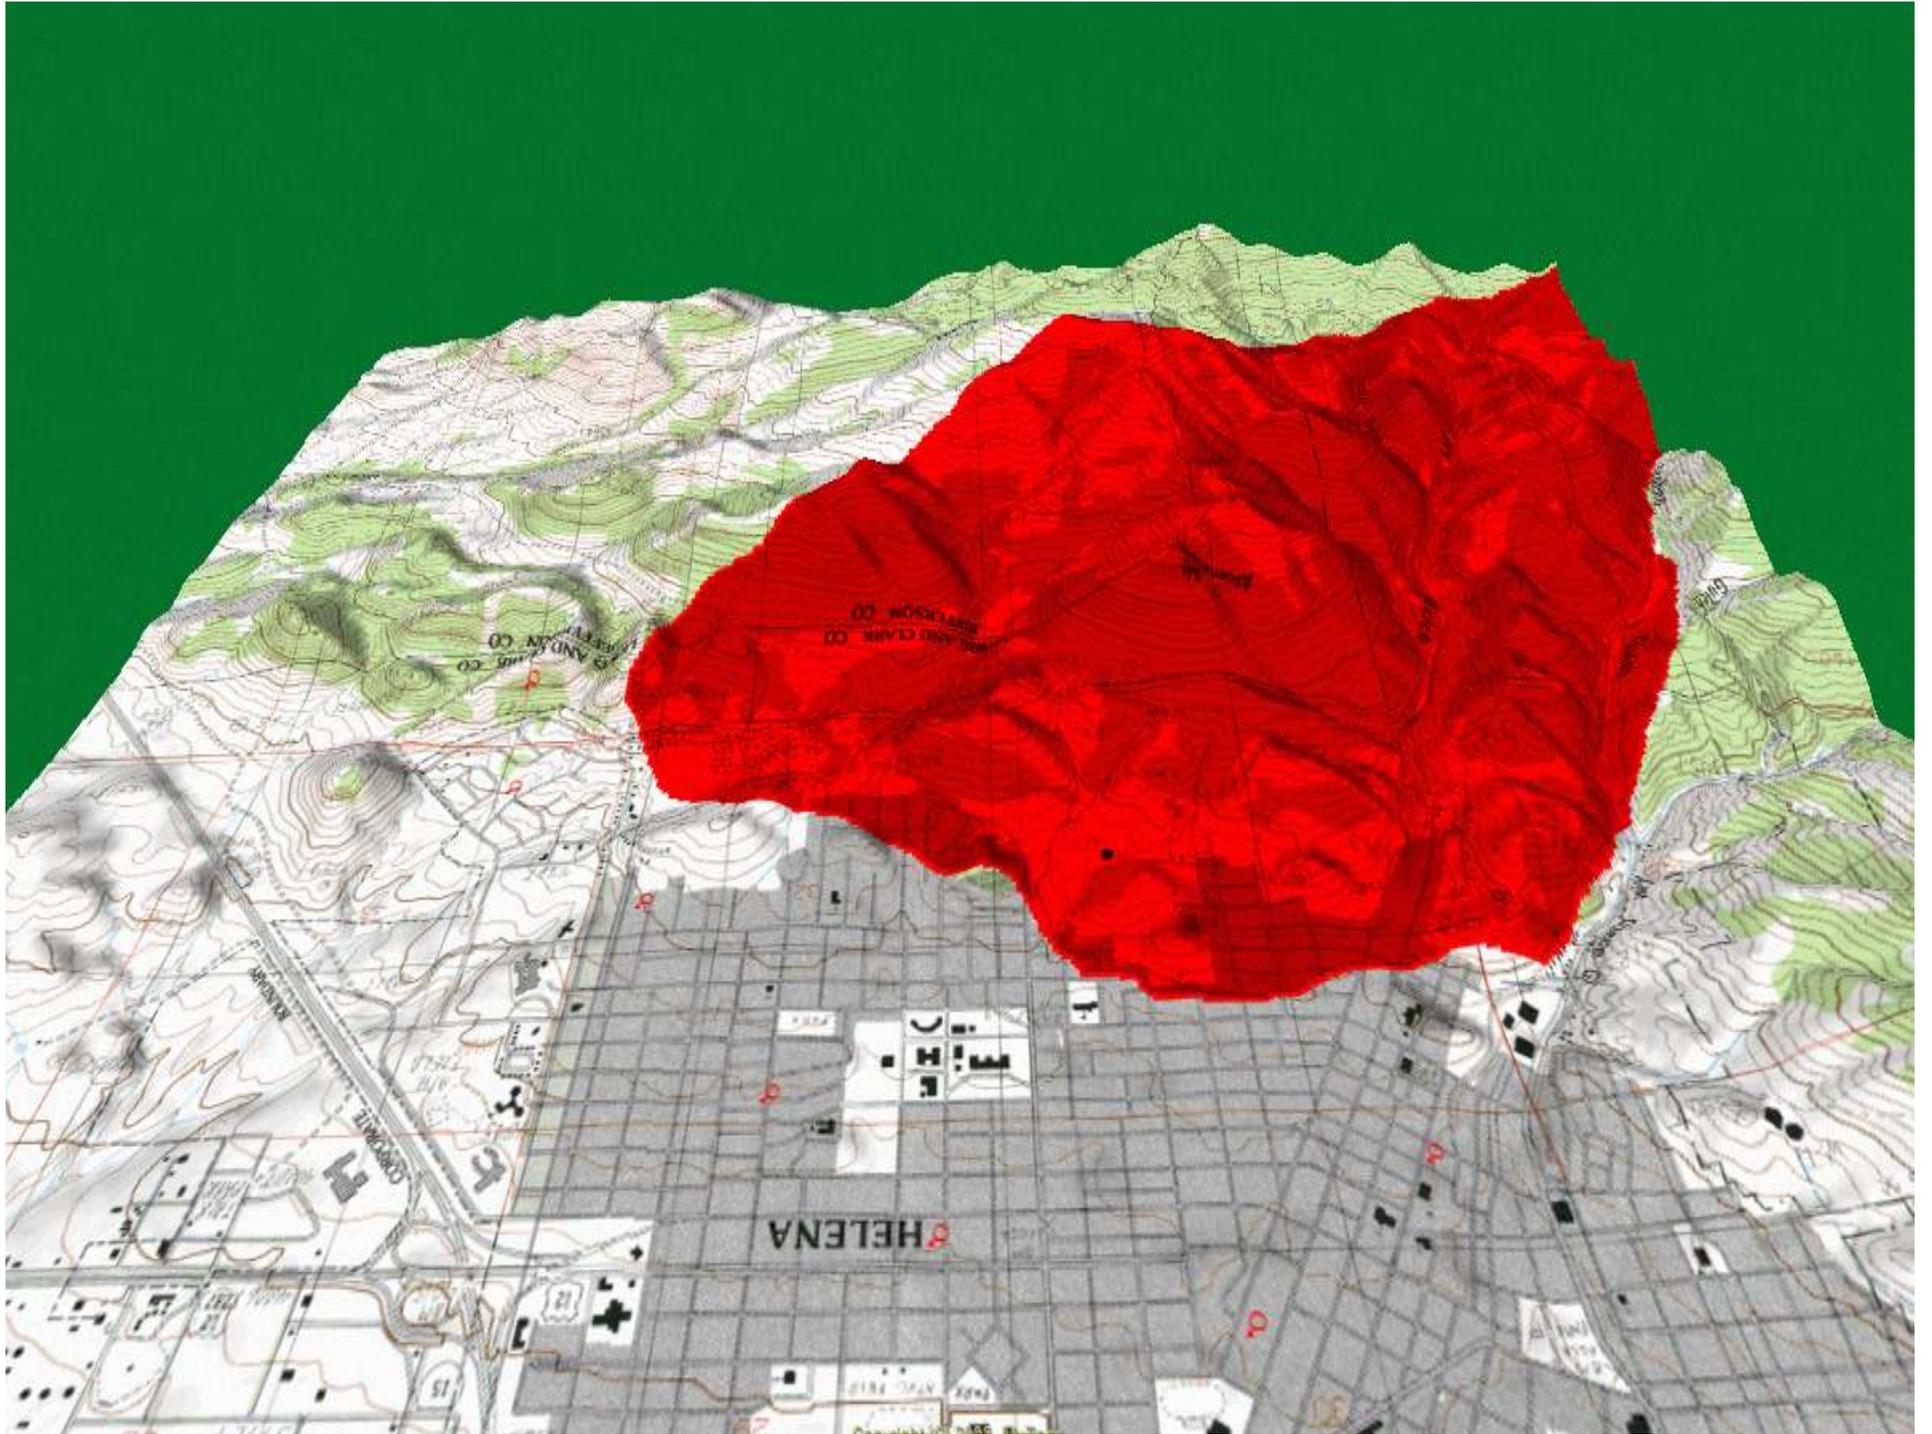

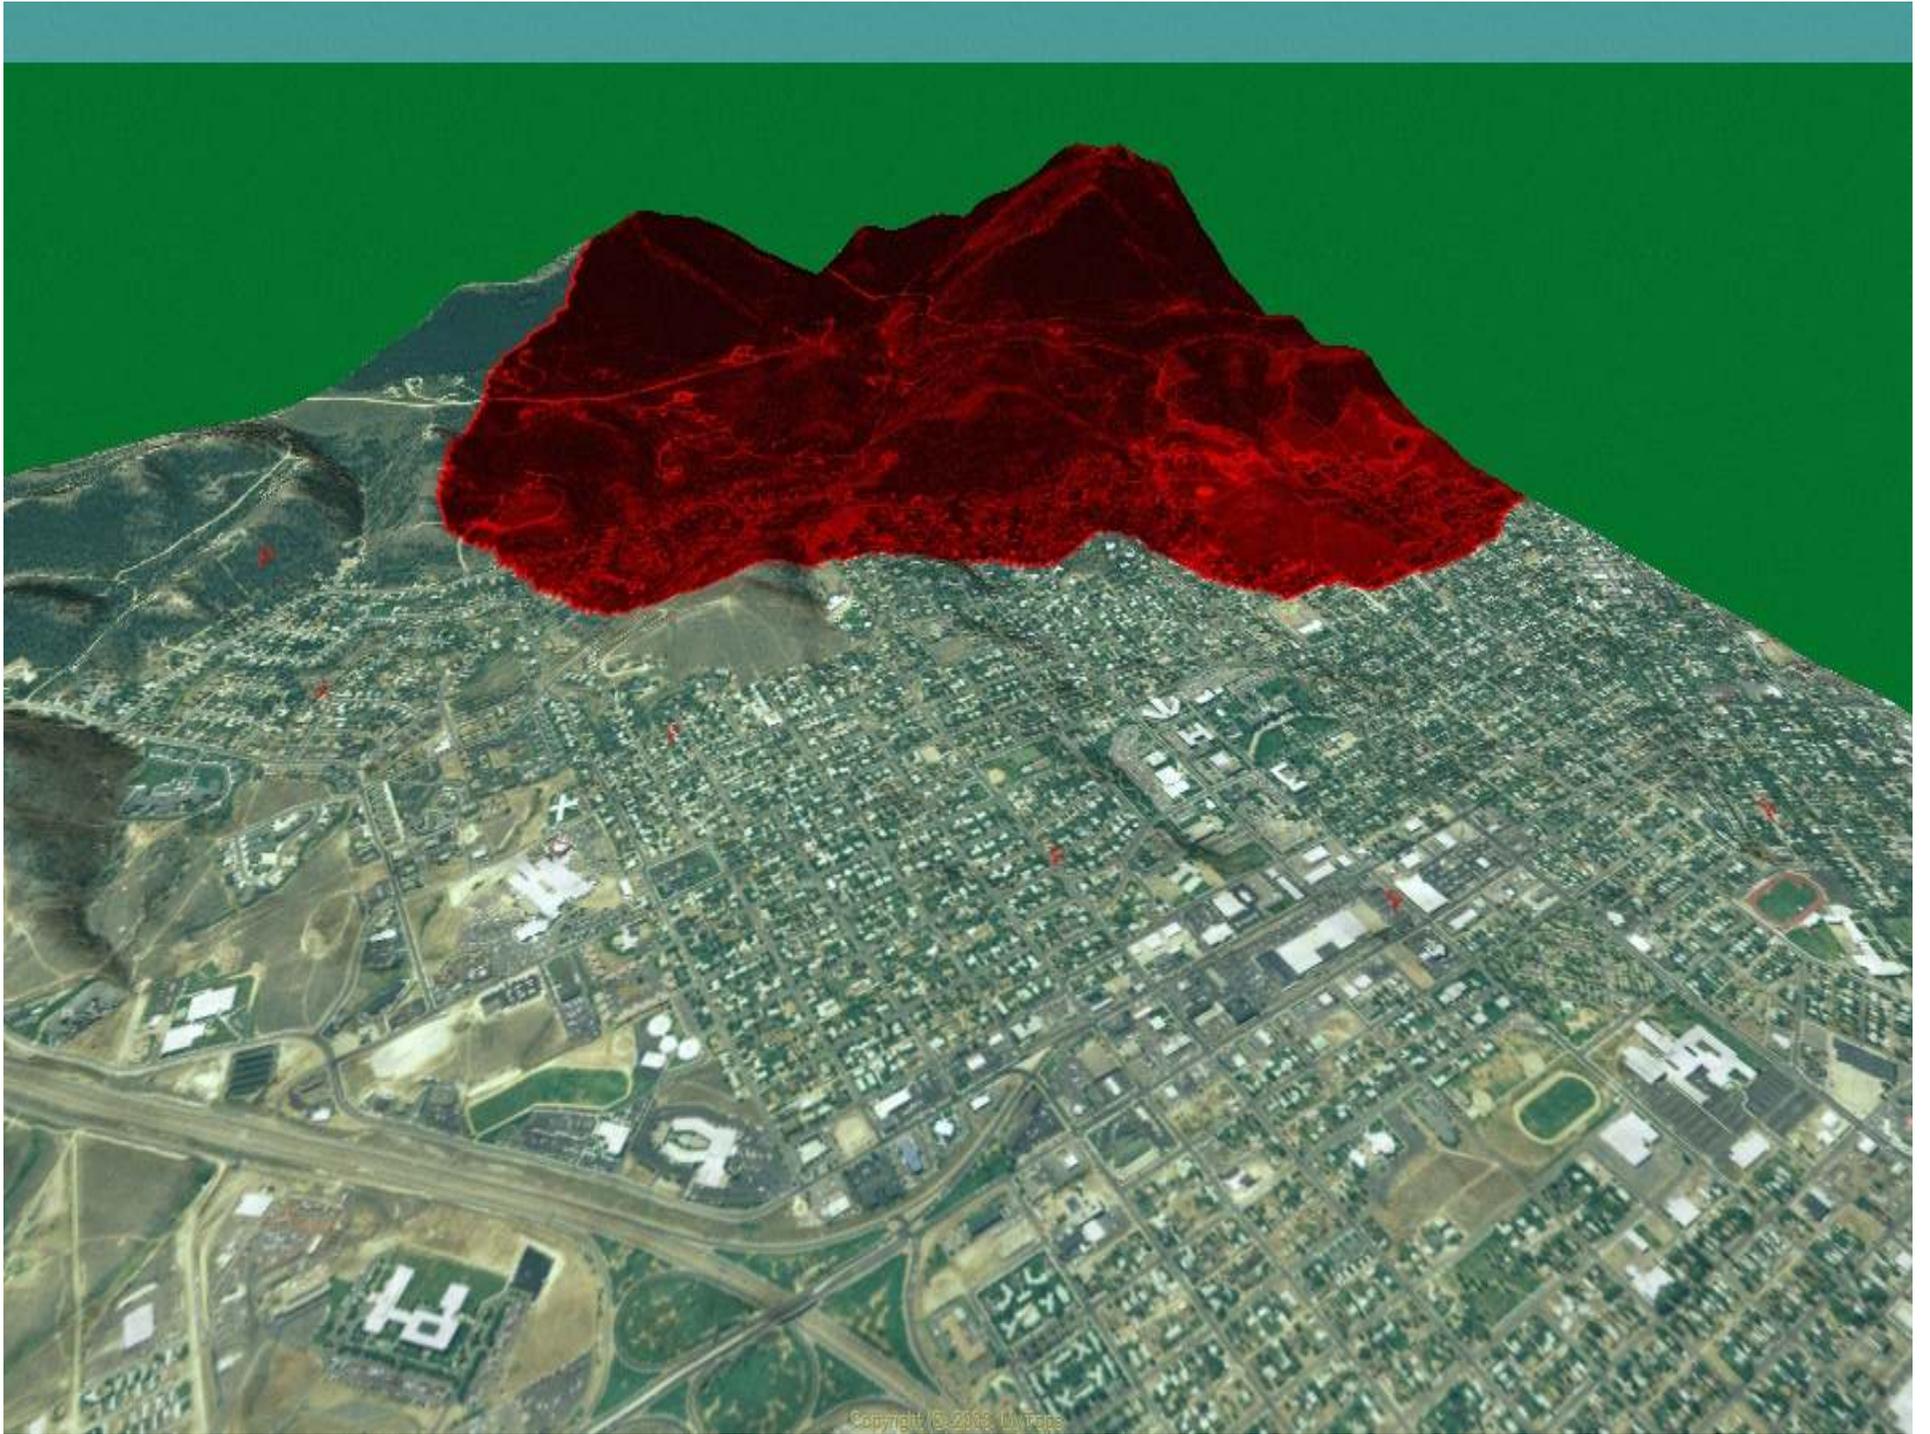

Large fires can cause embers to fly miles away and cause other smaller fires called spot fires

Fifth Hour 4:00 – 5:00pm
+/- 4,220 acres

Many residents live in among the red and dead trees and don't even realize the danger they are in

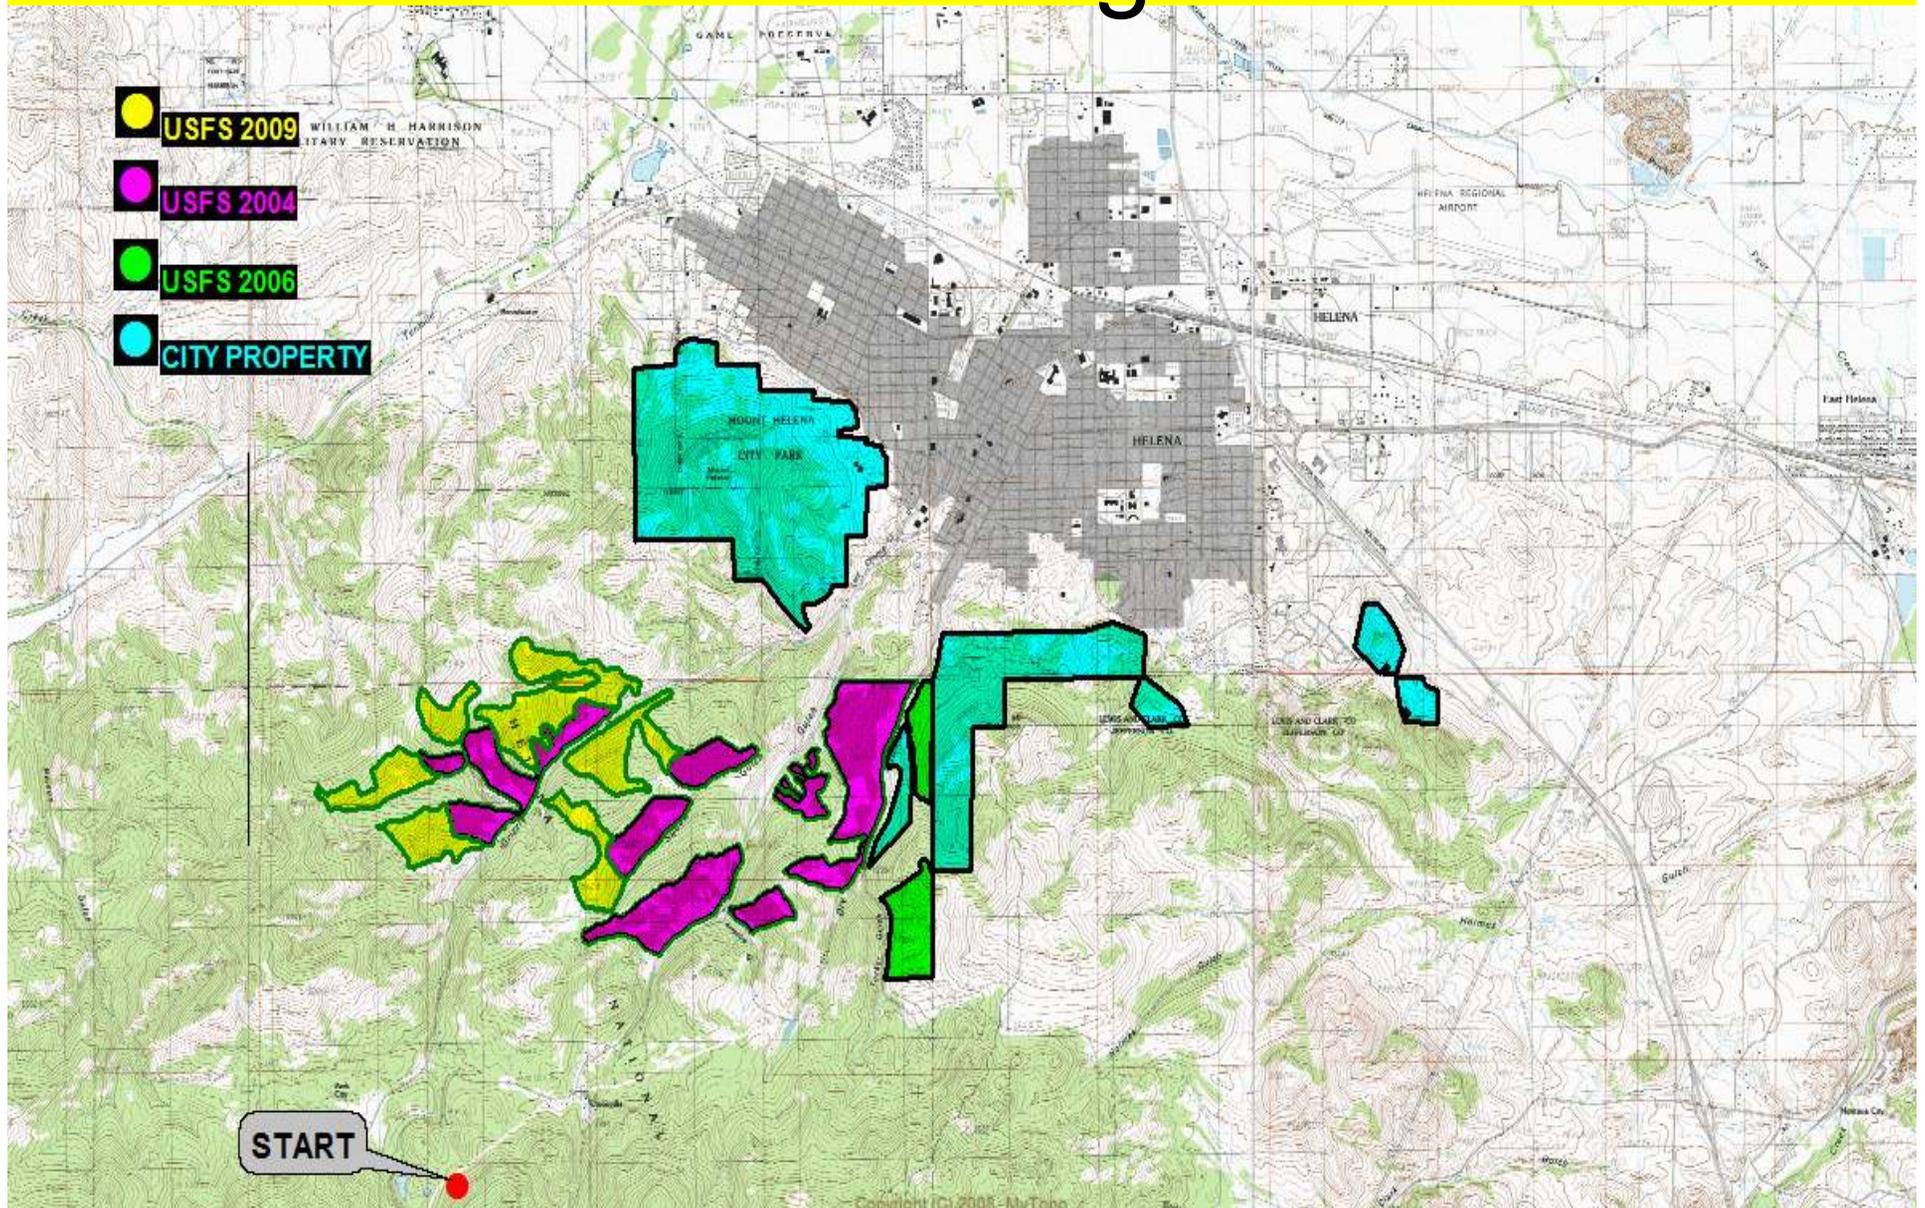

**A wildland fire coming into our
city and into your home is
possible.
Are you Prepared**

The Following Slides Depict Fire Behavior Following Treatment

FIRE BEHAVIOR POTENTIAL WHEN FIRE ENTERS TREATED FUELS

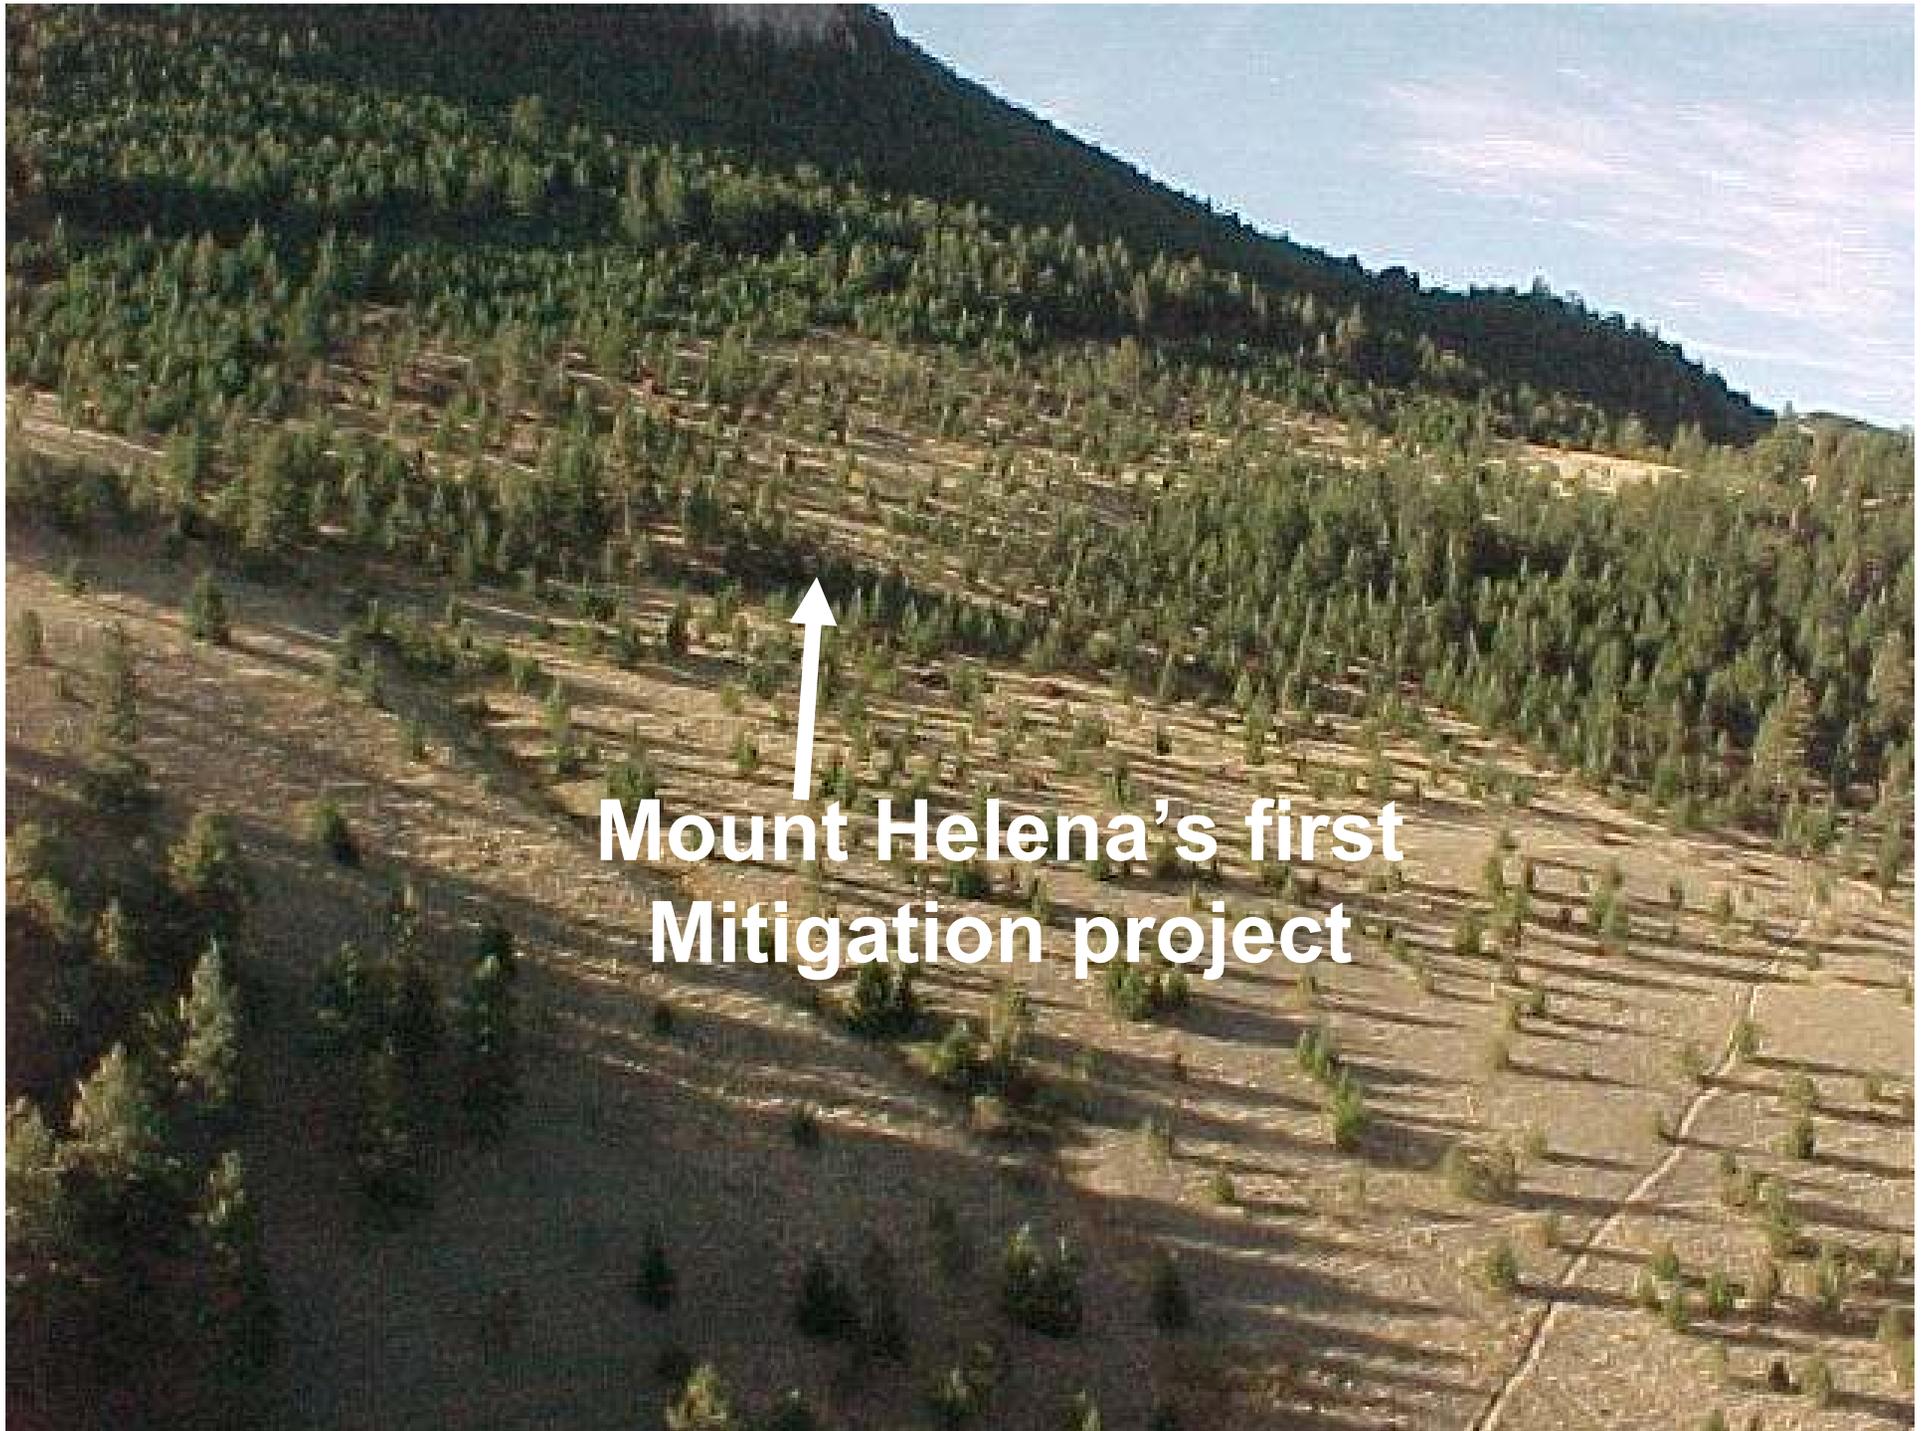

- **Assumes dead trees have been removed with 15-20 foot crown separation of remaining trees and pruned to 6 feet.**
- **Assumes understory and slash has been treated by either chipping or burning.**
- **Fire would remain a surface fire with up to five foot flame lengths. **A crown fire could not be sustained!****
- **Rate-of-Spread would be reduced to about 1/4 mile per hour depending upon amount of surface fuel, i.e. chips or cured grass.**

**Camp 32 Fire Photo Showing the difference between
Untreated(Left) and Treated (Right) Fuels.**

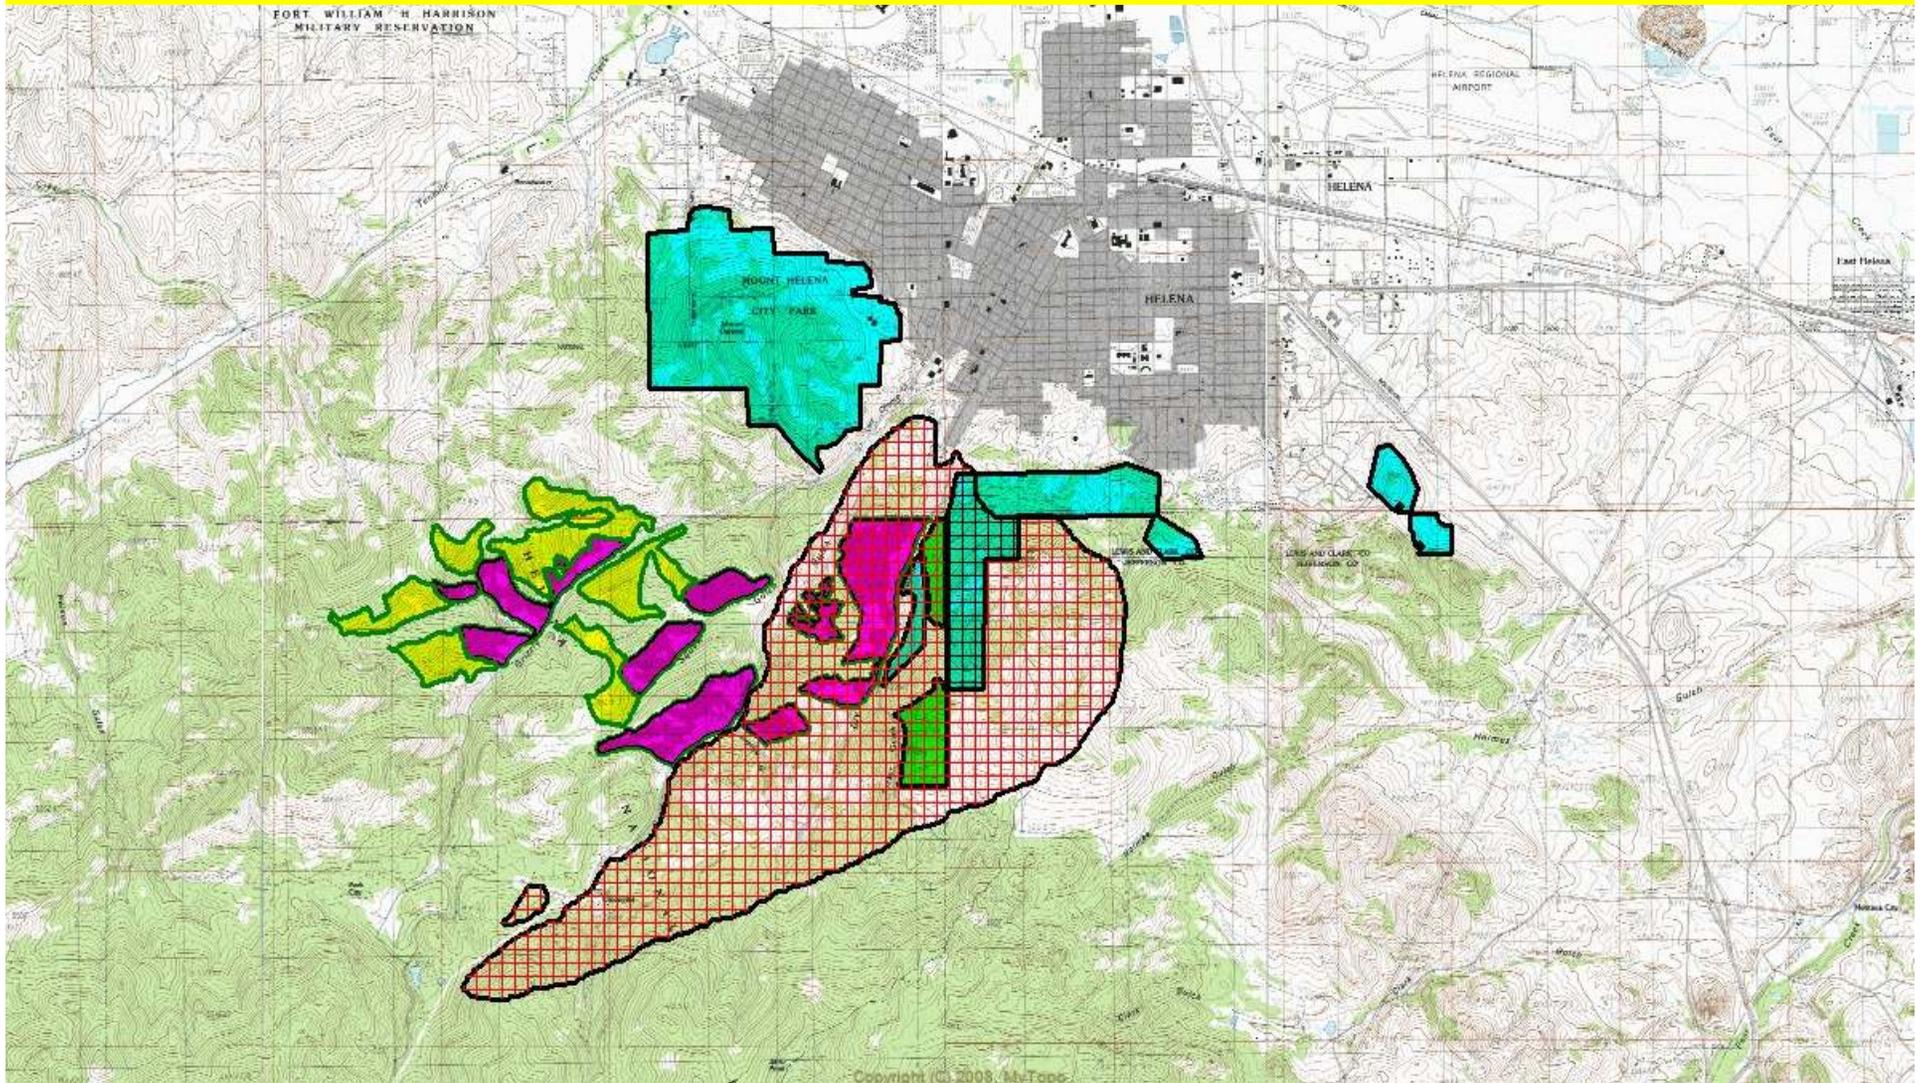

Camp 32 Fire – Fire Effects of Treated Fuels

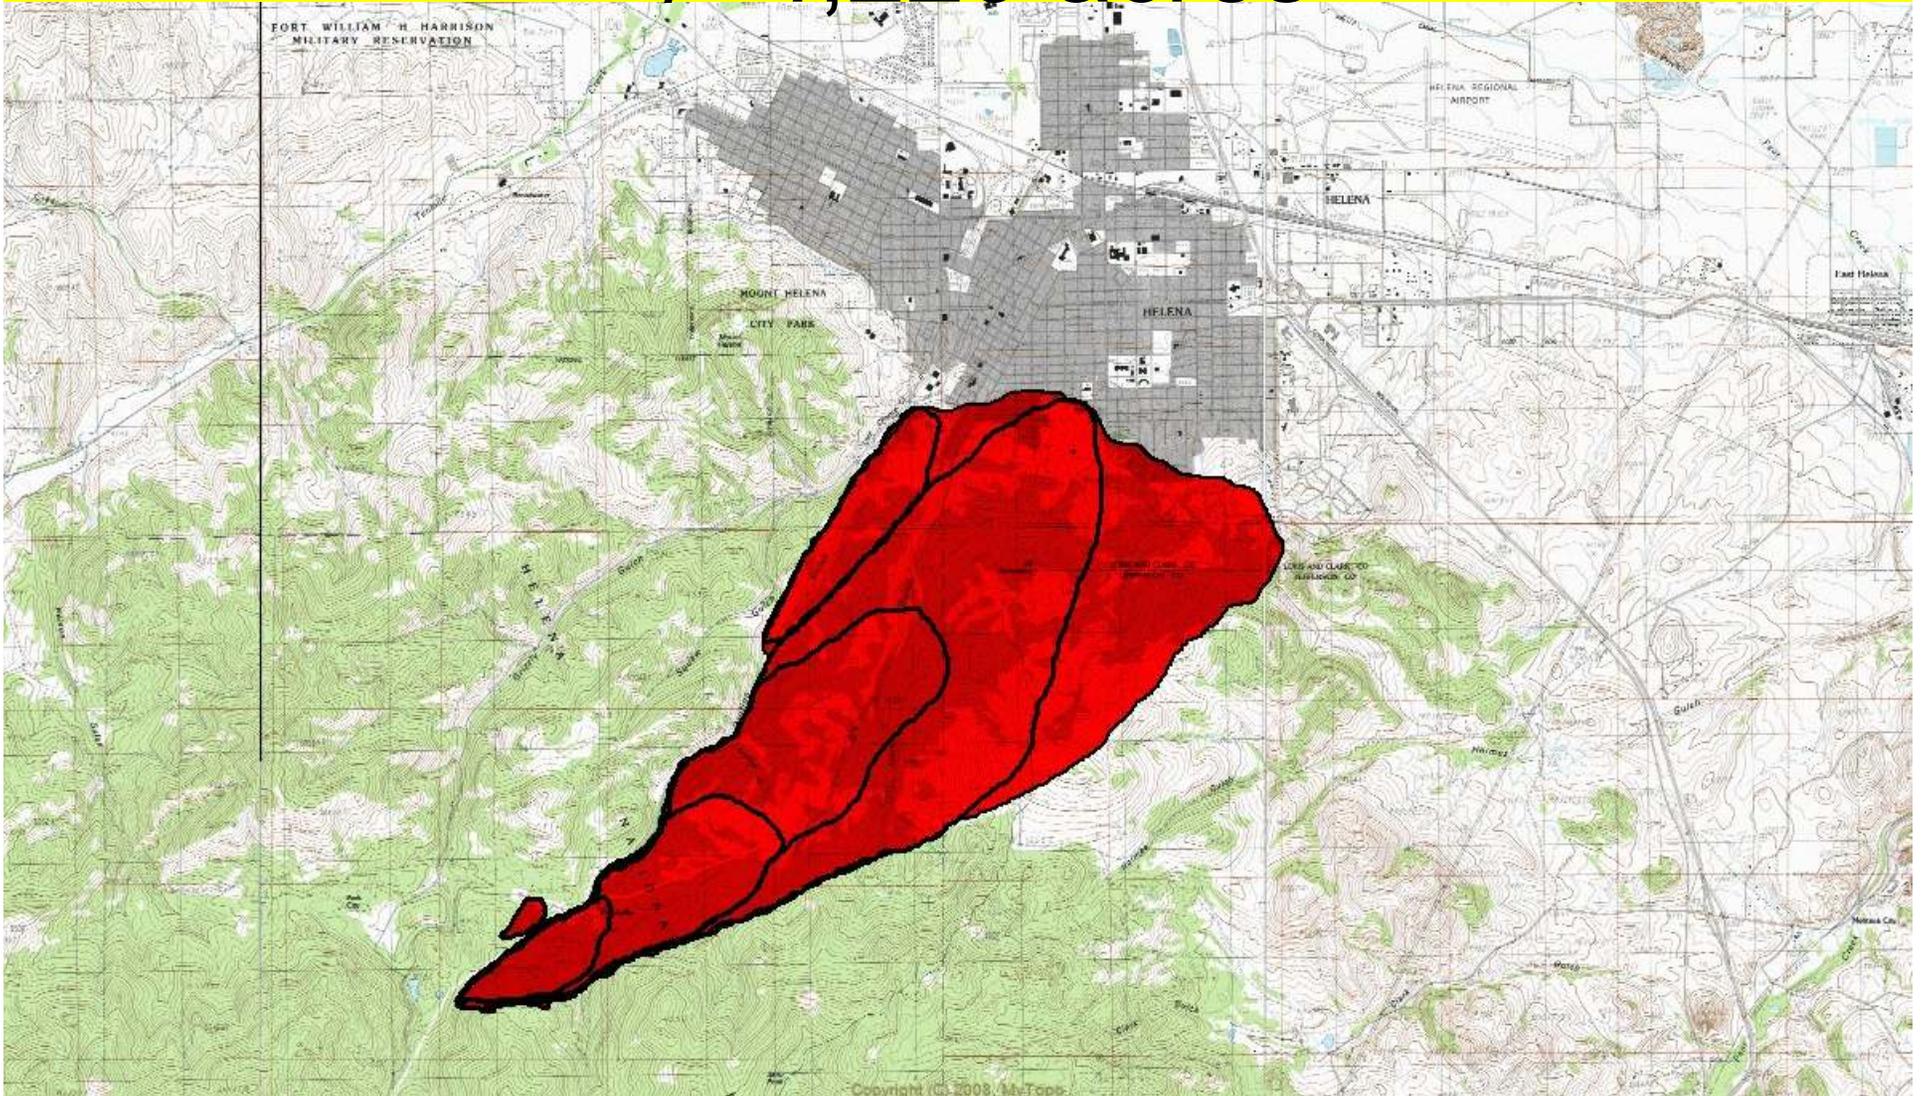

**Mount Helena's first
Mitigation project**

Fifth Hour With Treatment Fire has not entered the City of Helena +/- 3,140 acres

Fifth Hour Without Treatment
Fire has entered the City of Helena
+/- 4,220 acres

FIRE BEHAVIOR

POST DOWNFALL

- Assumes all dead trees have fallen to the ground with none removed.
- In this climate all small limbs and needles would remain on the ground as fine fuels for decades.
- Total fuel load could be over 100 tons per acre.
- Some young trees would be growing up through the dead and down logs.

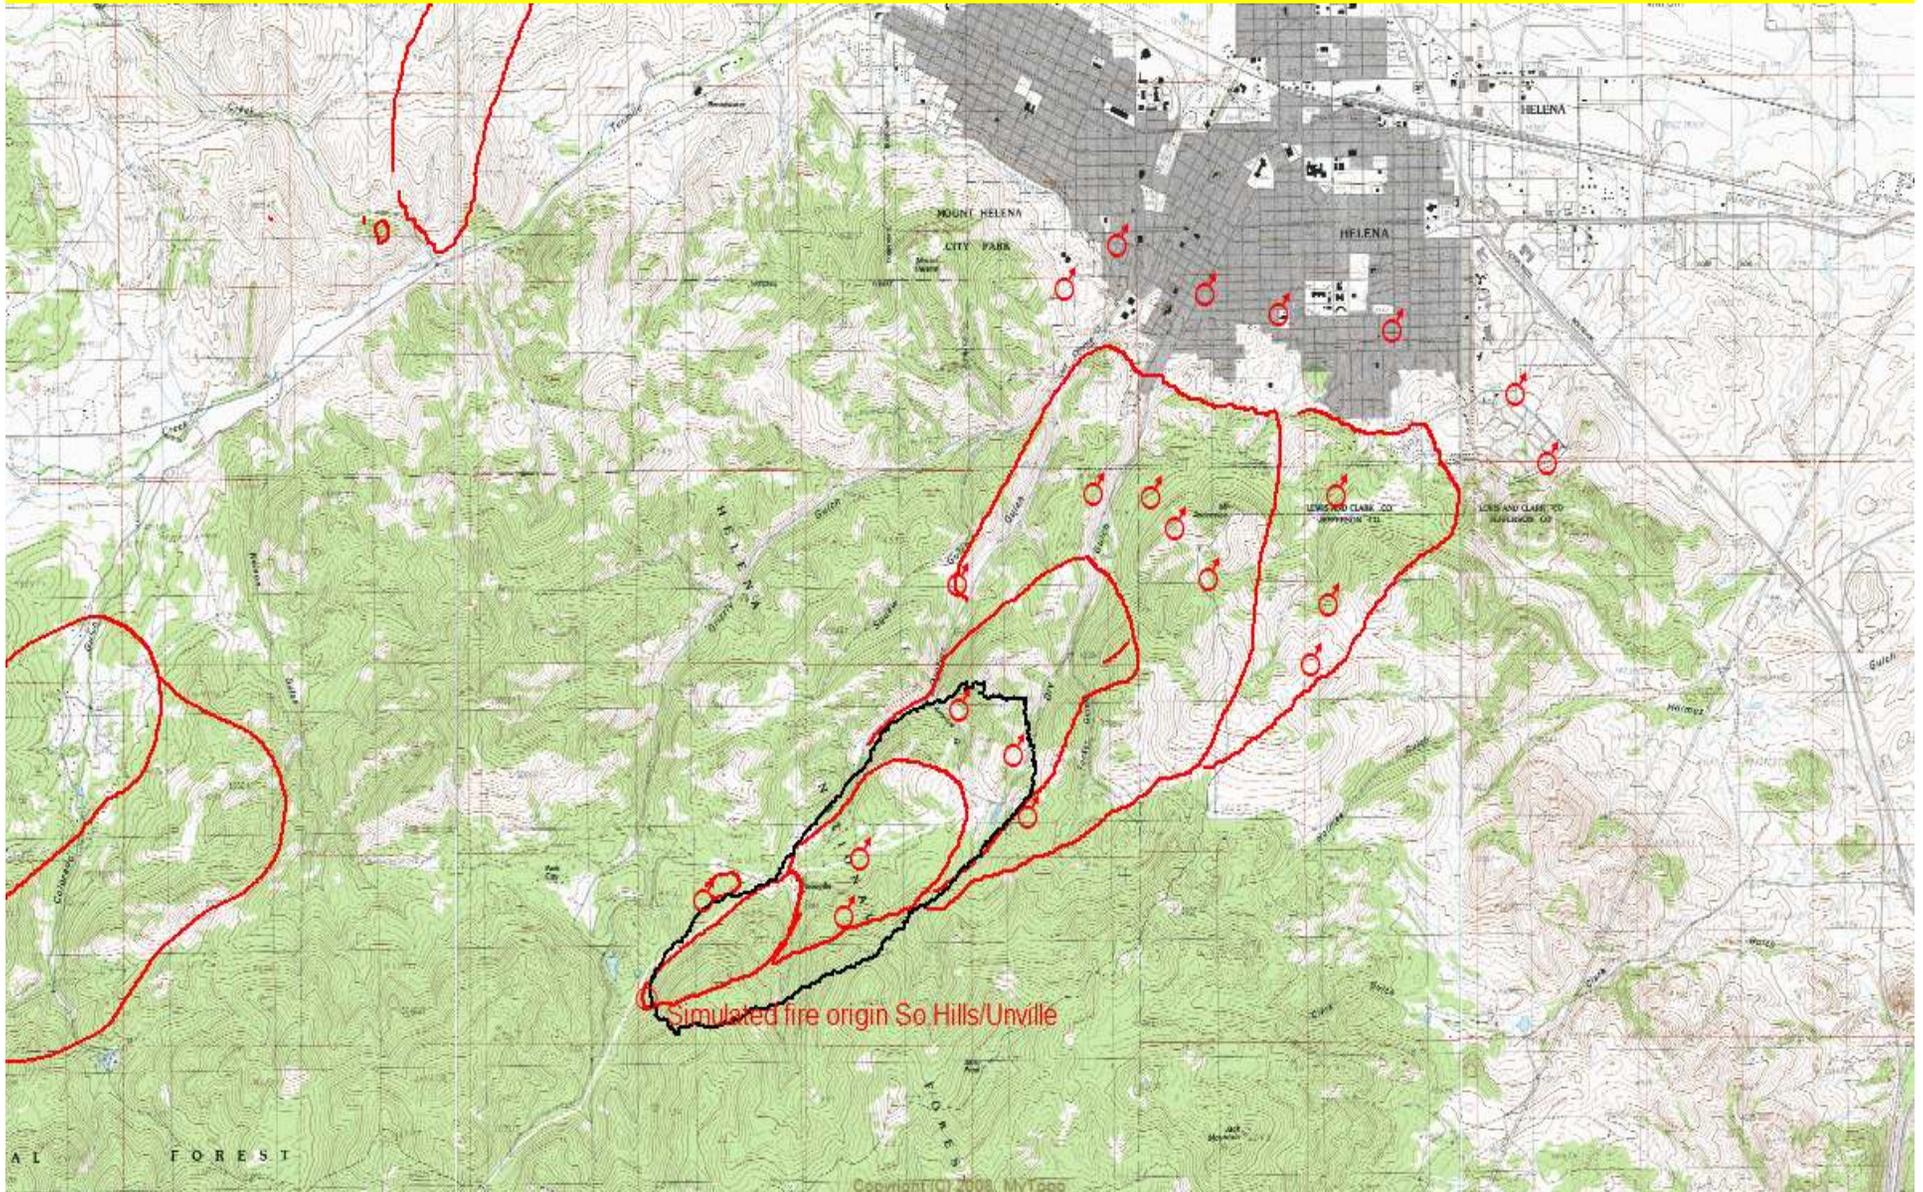

FIRE BEHAVIOR FUEL MODEL 13

- Fires spread quickly through the fine fuels.
- Intensity builds up more slowly as the large fuels start burning.
- Active flaming is sustained for long periods.
- A wide variety of firebrands can be generated.
- These contribute to spotting problems as the weather conditions become more severe.

FIRE BEHAVIOR INTERPRETATION

- Surface fire ROS up to ½ mile per hour.
- Flame lengths from 14 to 18 feet.
- An active crown fire could not be sustained.
- Some remaining green trees could torch out lofting embers .3 mile down wind with 100% Probability of Ignition.
- Within one hour a fire start could be as much as 40 acres in size.
- Control efforts at the head of the fire would be ineffective.

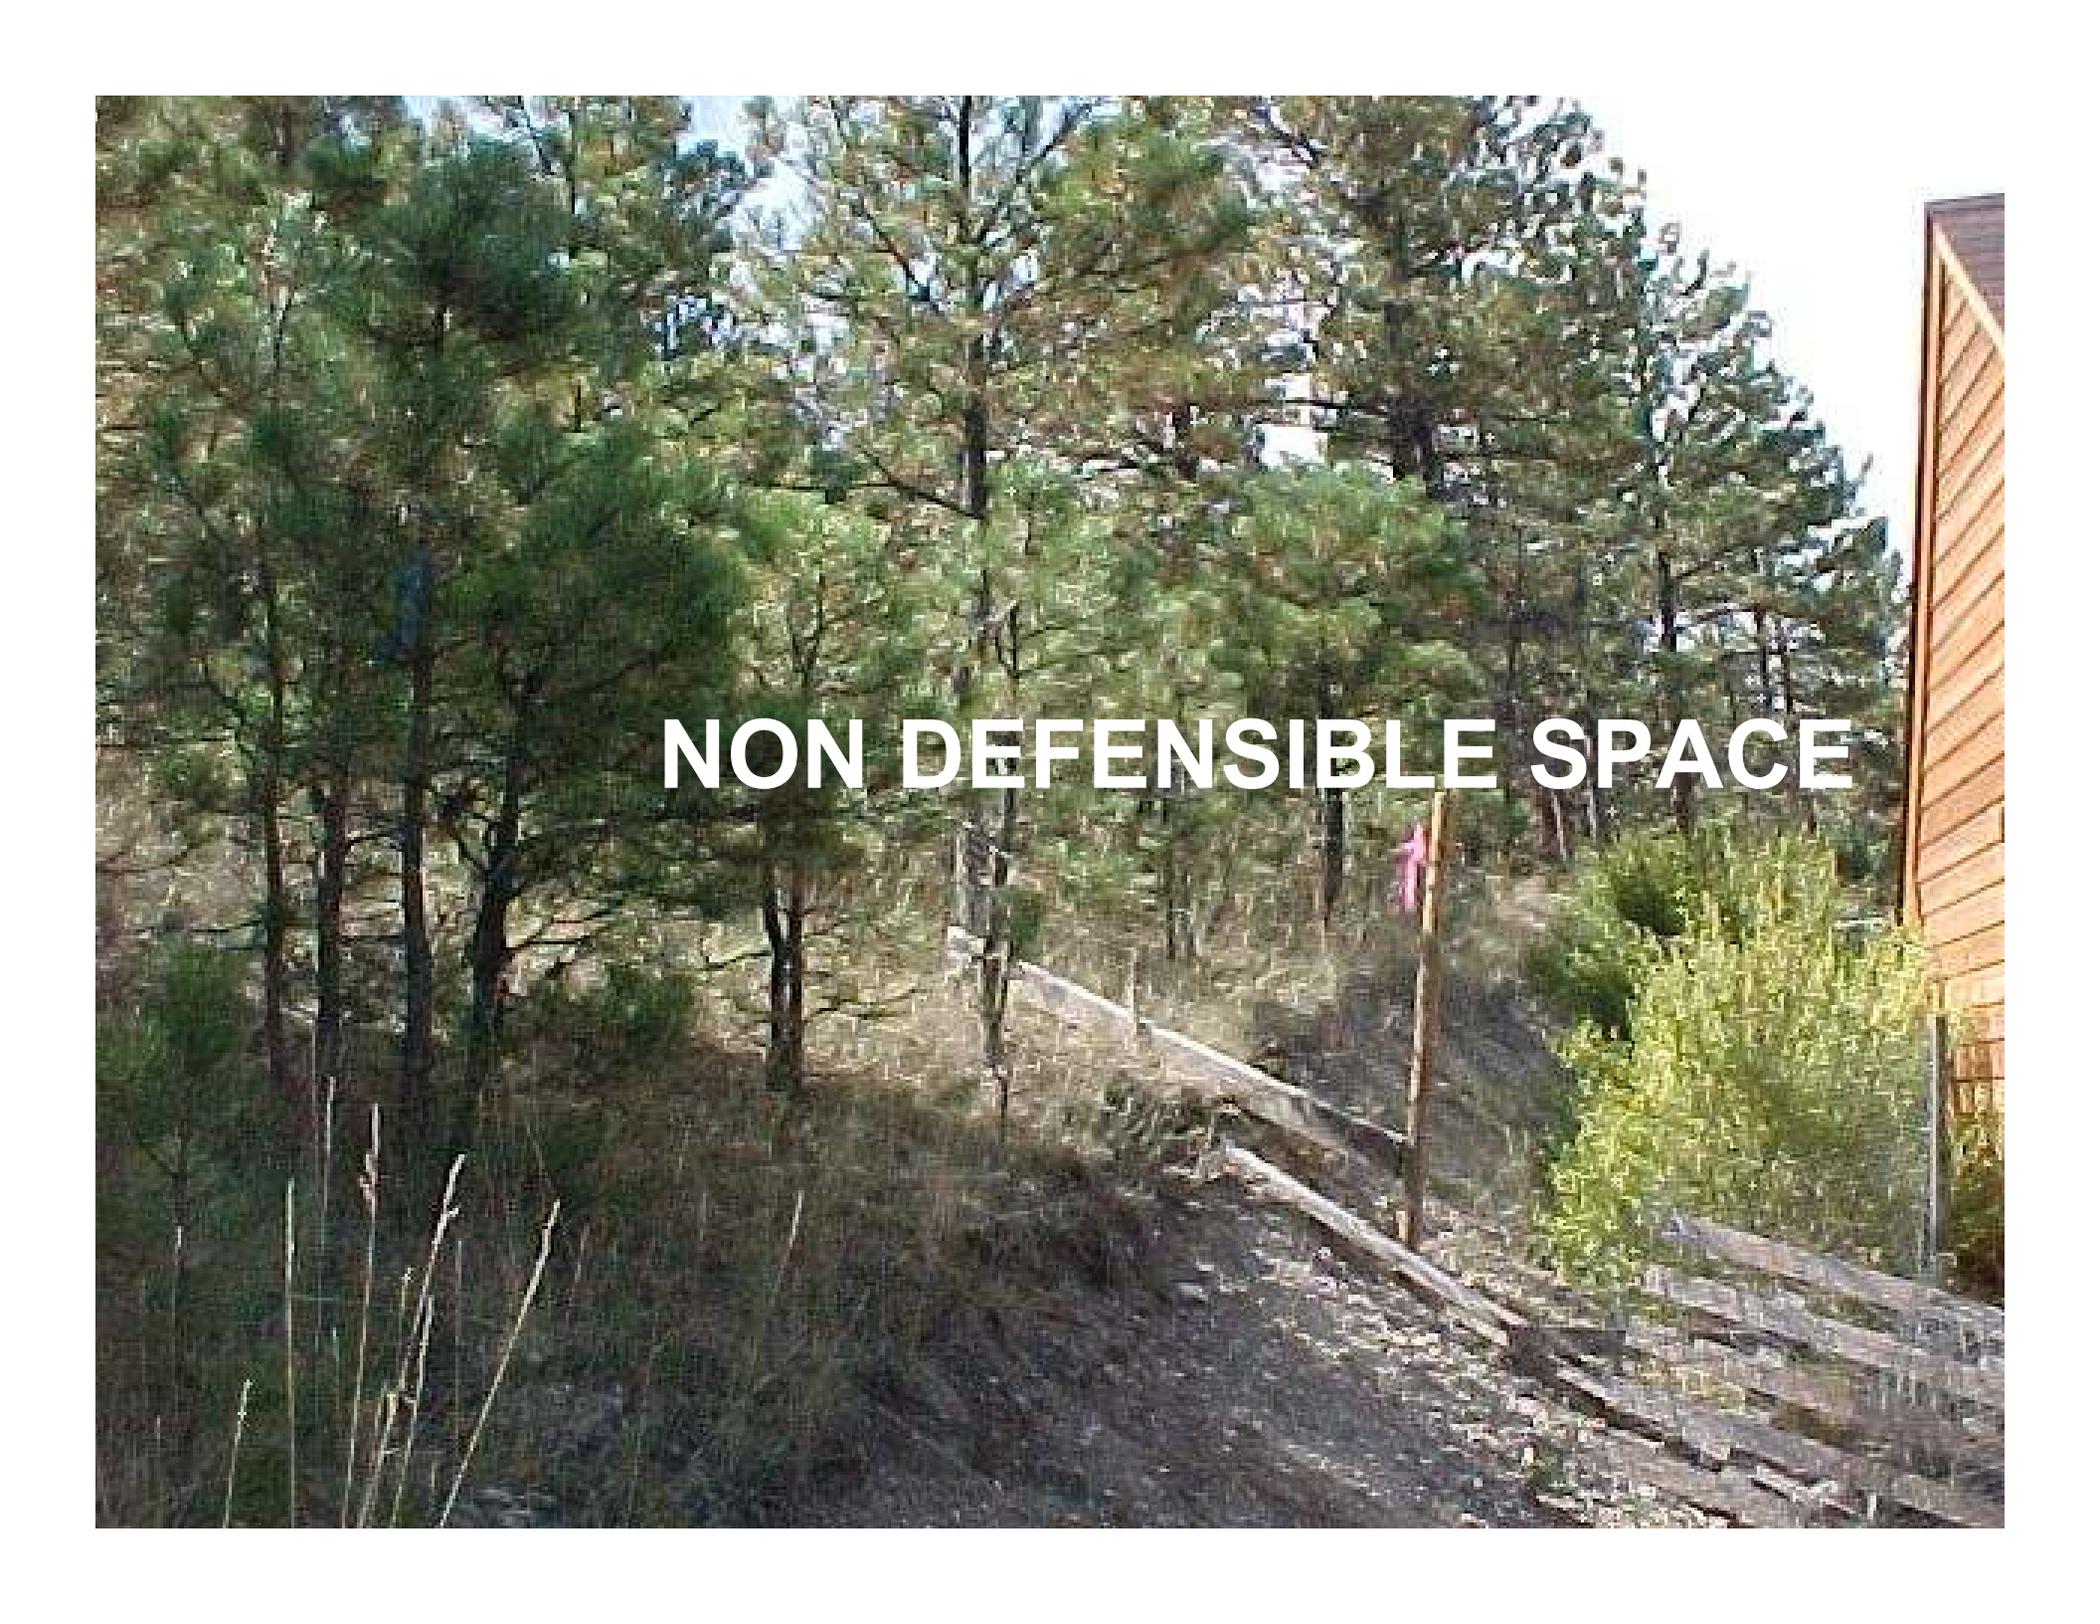

Black is perimeter of “Post Downfall”
after five hours

Hydrophobic Soils Following Intense Fire

A photograph showing a wooded area with a wooden fence in the foreground. The fence is made of weathered wooden planks and posts. To the right, a portion of a house with light-colored horizontal siding is visible. The background is filled with tall, thin trees, likely pines. The text "NON DEFENSIBLE SPACE" is overlaid in the center of the image in a bold, white, sans-serif font.

NON DEFENSIBLE SPACE

SAVE YOUR PROPERTY

A photograph of a pine forest with a dirt path. The trees are tall and green, and the ground is covered in brown pine needles and some green shrubs. The text "BE SAFE AND AWARE" is overlaid in the center of the image.

BE SAFE AND AWARE

A photograph of a pine forest with a house visible in the background, overlaid with the text "MITIGATE YOUR PROPERTY AND PREPARE TO EVACUTATE". The image shows a dense stand of tall, thin pine trees with green needles. The ground is covered in dry, yellowish-brown grass and pine needles. In the background, a house with a light-colored roof is partially visible through the trees. The sky is a clear, pale blue.

**MITIGATE YOUR PROPERTY
AND
PREPARE TO EVACUTATE**
